For safe and correct use, read this manual and the outdoor unit installation manual thoroughly before installing the air-conditioner unit.
1. Safety precautions

- Be sure to safely dispose of the packaging materials. Packaging materials, when burned, may emit hazardous gases. Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- For installation work, follow the instructions in the Installation Manual and use tools and pipe components specifically made for use with R410A refrigerant. The R410A refrigerant in the HFC system is pressurized 1.6 times the pressure of usual refrigerants. If pipe components not designed for R410A refrigerant are used and the unit is not installed correctly, the pipes may burst and cause damage or injuries. In addition, water leakage, electric shock, or fire may result.

- The unit must be installed accurately so that the pipes are not located over the ceiling, floor, or important items. The refrigerant may leak during operation. If the refrigerant comes into contact with a flame, poisonous gases will be released.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. If the pipes are not connected correctly, the unit will not be properly grounded and electric shock may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use only accessories authorized by Mitsubishi Electric and ask a dealer or an authorized technician to install them. If accessories are incorrectly installed, water leakage, electric shock, or fire may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- The unit must be installed accurately so that the pipes are not located over the ceiling, floor, or important items. The refrigerant may leak during operation. If the refrigerant comes into contact with a flame, poisonous gases will be released.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. If the pipes are not connected correctly, the unit will not be properly grounded and electric shock may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. If the pipes are not connected correctly, the unit will not be properly grounded and electric shock may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. If the pipes are not connected correctly, the unit will not be properly grounded and electric shock may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. If the pipes are not connected correctly, the unit will not be properly grounded and electric shock may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. If the pipes are not connected correctly, the unit will not be properly grounded and electric shock may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.

- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. If the pipes are not connected correctly, the unit will not be properly grounded and electric shock may result.

- Do not alter the unit. Consult a dealer for repairs. If alterations or repairs are not performed correctly, water leakage, electric shock, or fire may result.

- Do not install the unit where combustible gases may leak, be produced, flow, or accumulate. If combustible gas accumulates around the unit, the pipes may burst and cause damage or injuries.

- All electric work must be performed by a qualified technician according to local regulations and the instructions given in this manual. The units must be powered by dedicated power lines and the correct voltage and circuit breakers must be used. Power lines with insufficient capacity or incorrect electrical work may result in electric shock or fire.
1. Safety precautions

1.3. Before electric work

Caution:
- Be sure to install circuit breakers. If not installed, electric shock may result.
- For the power lines, use standard cables of sufficient capacity. Otherwise, a short circuit, overheating, or fire may result.
- When installing the power lines, do not apply tension to the cables. If the connections are loosened, the cables can snap or break and overheating or fire may result.

1.4. Before starting the test run

Caution:
- Turn on the main power switch more than 12 hours before starting operation. Starting operation just after turning on the power switch can severely damage the internal parts. Keep the main power switch turned on during the operation season.
- Before starting operation, check that all panels, guards and other protective parts are correctly installed. Rotating, hot, or high voltage parts can cause injuries.
- Do not operate the air conditioner without the air filter set in place. If the air filter is not installed, dust may accumulate and breakdown may result.
- Do not touch any switch with wet hands. Electric shock may result.
- Do not touch the refrigerant pipes with bare hands during operation. The refrigerant pipes are hot or cold depending on the condition of the flowing refrigerant. If you touch the pipes, burns or frostbite may result.
- After stopping operation, be sure to wait at least five minutes before turning off the main power switch. Otherwise, water leakage or breakdown may result.

2. Installation location

- Select a location so that air can be blown into all corners of the room.
- Avoid locations exposed to outside air.
- Select a location free of obstructions to the airflow in and out of the unit.
- Avoid locations exposed to steam or oil vapour.
- Avoid locations where combustible gas may leak, settle or be generated.
- Avoid installation near machines emitting high-frequency waves (high-frequency welders, etc.)
- Avoid locations where the airflow is directed at a fire alarm sensor. (Hot air could trigger the alarm during the heating operation.)

! Warning:
The unit must be securely installed on a structure that can sustain its weight.

3. Installing the indoor unit

3.1. Check the indoor unit accessories (Fig. 3-1)

The indoor unit is provided with the following accessories.

<table>

* B: Suspension bolt pitch

3.3. Suspension structure (Give site of suspension strong structure) (Fig. 3-3)

- The ceiling work differs according to the construction of the building. Building constructors and interior decorators should be consulted for details.

1. Wooden structures
   - Use tie beams (single storied houses) or second floor beams (two story houses) as reinforcing members.
   - Wooden beams for suspending air conditioners must be sturdy and their sides must be at least 6 cm long if the beams are separated by not more than 90 cm and their sides must be at least 9 cm long if the beams are separated by as much as 180 cm. The size of the suspension bolts should be ø10 (3/8”). (The bolts do not come with the unit.)

2. Ferro-concrete structures
   - Secure the suspension bolts using the method shown, or use steel or wooden hangers, etc. to install the suspension bolts.

3.4. Unit suspension procedures (Fig. 3-4)

Suspend the main unit as shown in the Fig. 3-4.

1. When no air intake duct flange is used.
2. When air intake duct flange is used.

Caution:
- Make sure that the unit is level when installed.
- Work with the protection gloves when you install the unit. (Take care of a hurt.)

To prevent getting hurt.
4. Installing the refrigerant piping

4.1. Precautions

4.1.1. For devices that use R407C refrigerant

- Do not use the existing refrigerant piping.
- Do not use crushed, misshapen, or discolored tubing. The inside of the tubing should be clean and free from harmful sulfuric compounds, oxidants, dirt, debris, oils and moisture.
- Store the piping to be used during installation indoors and keep both ends of the piping sealed until just before brazing.
- Use ester oil, ether oil or alkylbenzene (small amount) as the refrigerator oil to coat flares and flange connections.
- Use liquid refrigerant to fill the system.
- Do not use a refrigerant other than R407C.
- Use a vacuum pump with a reverse flow check valve.
- Do not use the tools that are used with conventional refrigerants.
- Do not use a charging cylinder.
- Be especially careful when managing the tools.
- Do not use commercially available dryers.

4.1.2. For devices that use R410A refrigerant

- Use ester oil, ether oil, alkylbenzene oil (small amount) as the refrigeration oil applied to the flared sections.
- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. Use refrigerant pipes with the thicknesses specified in the table below. Make sure the insides of the pipes are clean and do not contain any harmful contaminants such as sulfuric compounds, oxidants, debris, or dust.

Warning:
When installing or moving the air conditioner, use only the specified refrigerant (R410A) to charge the refrigerant lines. Do not mix it with any other refrigerant and do not allow air to remain in the lines. Air enclosed in the lines can cause pressure peaks resulting in a rupture and other hazards.

<table>
<thead>
<tr>
<th>Available pipe size</th>

</tr>
<tr>
<td>o15.88 thickness 1.0 mm</td>
</tr>
</tbody>
</table>

- Do not use pipes thinner than those specified above.

4.2. Indoor unit (Fig. 4-1)

- When commercially available copper pipes are used, wrap liquid and gas pipes with commercially available insulation materials (heat-resistant to 100 °C or more, thickness of 12 mm or more).
- The indoor parts of the drain pipe should be wrapped with polyethylene foam insulation materials (specific gravity of 0.03, thickness of 9 mm or more).
- Apply thin layer of refrigerant oil to pipe and joint seating surface before tightening flare nut.
- Use two wrenches to tighten piping connections.
- Use leak detector or soapy water to check for gas leaks after connections are completed.
- Use refrigerant piping insulation provided to insulate indoor unit connections. Insulate carefully following shown below.
- Use correct flare nuts meeting the pipe size of the outdoor unit.

![Fig. 4-1](image)

4.1.2. For devices that use R410A refrigerant

- Use ester oil, ether oil, alkylbenzene oil (small amount) as the refrigeration oil applied to the flared sections.
- Use C1220 copper phosphorus, for copper and copper alloy seamless pipes, to connect the refrigerant pipes. Use refrigerant pipes with the thicknesses specified in the table below. Make sure the insides of the pipes are clean and do not contain any harmful contaminants such as sulfuric compounds, oxidants, debris, or dust.

![Fig. 4-1](image)
4. Installing the refrigerant piping

4.3. Refrigerant and drainage piping locations of indoor unit (Fig. 4-3)
- Refrigerant pipe (gas)
- Refrigerant pipe (liquid)
- Drain pipe
- Air filter (option)
- Ceiling

4.4. Refrigerant piping (Fig. 4-4)
Heat insulation for refrigerant pipes:
1. Wrap the enclosed large-sized pipe cover around the gas pipe, making sure that the end of the pipe cover touches the side of the unit.
2. Wrap the enclosed small-sized pipe cover around the liquid pipe, making sure that the end of the pipe cover touches the side of the unit.
3. Secure both ends of each pipe cover with the enclosed bands. (Attach the bands 20 mm from the ends of the pipe cover.)
4. After connecting the refrigerant piping to the indoor unit, be sure to test the pipe connections for gas leakage with nitrogen gas. (Check that there is no refrigerant leakage from the refrigerant piping to the indoor unit.) Conduct the airtightness test before connecting the outdoor unit stop valve and the refrigerant pipe.
5. If the test is conducted after the valve and pipe are connected, gas, which is used for checking the airtightness, will leak from the stop valve and flow into the outdoor unit, resulting in abnormal operation.

4.5. For twin/triple combination
Refer to the outdoor unit installation manual.

5. Drainage piping work (Fig. 5-1)

- The drainage pipe should be arranged so that the discharge end is lower than the other end, as shown in the figure opposite.
- Place the trap outside the unit.
- After connecting the drainage pipe, make sure that water is discharged properly and that there are no leaks.

6. Electrical work

6.1. Indoor unit
1. Remove the two electrical parts cover (2 screws). (Fig. 6-1)
- Electrical parts cover
- Knockout holes
- Terminal bed (Indoor/Outdoor unit)
- Terminal bed (Remote controller)
- Indoor controller board
- Indoor/Power board

2. Open knockout holes. (Fig. 6-2)
   (Recommend to use a screwdriver or the like for this work.)
   - Control box
   - Knockout hole
   - Remove
   - Knockout hole

3. Wire the Indoor/Outdoor connecting cables with buffer bushing for tensile force.
   (PG connection or the like)
   Wire the remote controller cables using ordinary bushing. (Fig. 6-3)
   - Install the earth cable, longer than other cables. (The earth cable dia.: Thicker than 1.6 mm)
   - Knockout hole for the Indoor/Outdoor connecting cable.
   - Use buffer bushing to prevent tensile force to the terminal bed.
   - The Indoor/Outdoor connecting cables
   - Tensile force
   - Knockout hole for the remote controller cables. Use ordinary bushing.
   - The remote controller cables

Selecting non-fuse breaker (NF) or earth leakage breaker (NV).
6. Electrical work

6.2. Indoor unit power supplied from outdoor unit

The following connection patterns are available.
The outdoor unit power supply patterns vary on models.

### 1:1 System

<table>
<thead>
<tr>

1. A breaker with at least 3 mm contact separation in each pole shall be provided. Use non-fuse breaker (NF) or earth leakage breaker (NV).
2. For 25-140 outdoor unit application:
   - Max. 45 m
   - If 2.5 mm² used, Max. 50 m
   - If 2.5 mm² used and S3 separated, Max. 80 m
   - For PUHZ-RP10D125/140 YHA application, use shield wires. The shield part must be grounded with the indoor unit OR the outdoor unit, NOT with both.
3. For 200/250 outdoor unit application:
   - Max. 18 m
   - If 4 mm² used and S3 separated, Max. 80 m
   - If 6 mm² used and S3 separated, Max. 80 m
4. The 10 m wire is attached in the remote controller accessory. Max. 500 m

Notes:
1. Wiring size must comply with the applicable local and national code.
2. Power supply cords and indoor unit/outdoor unit connecting cords shall not be lighter than polychloroprene sheathed flexible cord. (Design 245 IEC 57)
3. Install an earth longer than other cables.
6. Electrical work

6.3. Separate indoor unit/outdoor unit power supplies (For PUHZ application only)
The following connection patterns are available. The outdoor unit power supply patterns vary on models.

### 1:1 System

**<For models without heater>**
- The indoor power supply terminal kit is required.

<table>
<thead>
<tr>
<th>Indoor power supply terminal kit (option)</th>

</tr>
</tbody>
</table>

- Main switch (breaker): 10 A
- Indoor unit power supply: 2 – Min. 1.5
- Indoor unit power supply earth: 2 – Min. 1.5
- Indoor unit-outdoor unit: 2 – Min. 0.3
- Remote controller: 2 – 0.3 (Non-polar)
- Indoor unit-outdoor unit S1-S2: 4
- Indoor unit-outdoor unit S2-S3: 4
- Remote controller-outdoor unit: DC 12 V

* There are three types of labels (labels A, B, and C). Affix the appropriate labels to the units according to the wiring method.

**Notes:**
1. Wiring size must comply with the applicable local and national code.
2. Power supply cords and indoor unit/outdoor unit connecting cords shall not be lighter than polyethylene sheathed flexible cord. (Design 245 IEC 57)
3. Install an earth longer than other cables.
6. Electrical work

6.4. Remote controller (Wired remote controller)

1) Installing procedures

(1) Select an installing position for the remote controller. (Fig. 6-4)

- The temperature sensors are located on both remote controller and indoor unit.

- Procure the following parts locally:
  - Two piece switch box
  - Thin copper conduit tube
  - Lock nuts and bushings
  - Remote controller profile
  - Remote controller cord
  - Installation pitch

(2) Seal the service entrance for the remote controller cord with putty to prevent possible invasion of dew drops, water, cockroaches or worms. (Fig. 6-5)

- For installation in the switch box:
  - For direct installation on the wall select one of the following:
    - Prepare a hole through the wall to pass the remote controller cord from the back, then seal the hole with putty.
    - Run the remote controller cord through the cut-out upper case, then seal the cut-out notch with putty similarly as above.

- B-1. To lead the remote controller cord from the back of the controller:

- B-2. To run the remote controller cord through the upper portion:

- (3) Two remote controllers setting

If two remote controllers are connected, set one to “Main” and the other to “Sub”. For setting procedures, refer to “Function selection of remote controller” in the operation manual for the indoor unit.

2) Connecting procedures (Fig. 6-6)

- Connect the remote controller cord to the terminal block.
  - To TB5 on the indoor unit
  - TBW (No polarity)

3) Two remote controllers setting

If two remote controllers are connected, set one to “Main” and the other to “Sub”. For setting procedures, refer to “Function selection of remote controller” in the operation manual for the indoor unit.

6.5. Function settings (Wired remote controller) (Fig. 6-7)

Changing the power voltage setting

- Be sure to change the power voltage setting depending on the voltage used.

- Go to the function setting mode.

- Switch OFF the remote controller.

- Press the [[] and [] buttons simultaneously for at least two seconds. FUNCTION will start to flash.

- Use the [[] and [] buttons to set the refrigerant address ([I]) to 00.

- Press the [[] button to set the unit number ([I]) to 00.

- Press the [[] button to designate the refrigerant address/unit number. [—] will flash in the mode number ([I]) display momentarily.

- Press the [[] buttons to set the mode number (1) to 04.

- Press the [[] button and the current set setting number (1) will flash.

- Use the [[] button to switch the setting number in response to the power supply voltage to be used.

- Power supply voltage
  - 240 V: setting number = 1
  - 220 V, 230 V: setting number = 2

- Press the MODE button [[] and mode and the setting number (1) and (11) will change to being on constantly and the contents of the setting can be confirmed.

- Press the FILTER [[] and TEST RUN [[] buttons simultaneously for at least two seconds. The function selection screen will disappear momentarily and the air conditioner OFF display will appear.

---

Notes:
1. When the power supply returns, the air conditioner will start 3 minutes later.
2. Power failure automatic recovery initial setting depends on the connecting outdoor unit.

7. Duct work (Fig. 7-1)

Use the canvas duct for connecting the indoor unit and the duct. Use fire-proof material for the duct parts.

Notes:
1. An outlet duct of 850 mm or more is needed for construction.
2. Connect the main body of the air conditioner and the duct so that their potentials are equal.
3. The standard external static pressure should be 125 Pa.
4. Connect an earth cable in the compressor. The insulation resistance will drop above 1 MΩ after the compressor is warmed up for two to three hours. After supplying power for the times indicated below, measure the insulation resistance again.
   a. The insulation resistance drops due to accumulation of refrigerant in the compressor. To operate the compressor with refrigerant accumulated in the compressor, the motor must be warmed up at least 12 hours to prevent breakdown.
   b. The insulation resistance drops due to accumulation of refrigerant in the compressor. The resistance will rise above 1 MΩ after the compressor is warmed up for two to three hours.
   c. The insulation resistance drops due to accumulation of refrigerant in the compressor. If existing pipes that carried R22 refrigerant are used for the RP3 model, these procedures are not necessary. (The replacement operation cannot be performed.)

8. Test run

8.1. Before test run

- After completing installation and the wiring and piping of the indoor and outdoor units, check for refrigerant leakage, looseness in the power supply or control wiring, wrong polarity, and no disconnection of one phase in the supply.
- Use a 500-volt megohmmeter to check that the resistance between the power supply terminals and ground is at least 1.0 MΩ.
- Do not carry out this test on the control wiring (low voltage circuit) terminals.

Warning: Do not use the air conditioner if the insulation resistance is less than 1.0 MΩ.

- Insulation resistance

After installation or after the power source to the unit has been cut for an extended period, the insulation resistance will drop below 1 MΩ due to refrigerant accumulating in the compressor. This is not a malfunction. Perform the following procedures.

3. After the insulation resistance drops below 1 MΩ, the compressor is faulty or the resistance dropped due to accumulation of refrigerant in the compressor. If existing pipes that carried R22 refrigerant are used for the RP3 model, these procedures are not necessary. (The replacement operation cannot be performed.)

Replacement operation procedures

- Supply power.
- Set DIP switch SW8-2 on the control board of the outdoor unit to ON to start replacement operation.
- The replacement operation is performed using the cooling system. Cool air will flow from the indoor unit during the replacement operation.
- The replacement operation is performed using the cooling system. Cool air will flow from the indoor unit during the replacement operation.
- During the replacement operation, LED1 and LED2 on the control board of the outdoor unit flash together.
- Replacement operation requires at least two hours to complete.
- If setting switch SW8-2 to OFF, the unit automatically stops after two hours.
- Replacement operation can be performed repeatedly by setting switch SW8-2 from OFF to ON. Wait at least two hours before starting replacement operation.
- If the indoor temperature is less than 10°C, the compressor will operate intermittently but the unit is not faulty.

8.2. During test run

- The followings must be checked as well.
  a. The outdoor unit is not faulty. LED1 and LED2 on the control board of the outdoor unit flash when the outdoor unit is faulty.
  b. Both the gas and liquid stop valves are completely open.
  c. A protective sheet covers the surface of the DIP switch panel on the control board of the outdoor unit. Remove the protective sheet to operate the DIP switches easily.
  
   - The standard external static pressure should be 125 Pa.
   - Connect an earth cable from the air intake duct to the earth terminal. Then, connect another earth cable from the earth terminal to the air outlet duct.

Fig. 7-1
8. Test run

8.2. Test run

The following 2 methods are available.

8.2.1. Using wired remote controller (Fig. 8-1)

1. Turn on the power at least 12 hours before the test run.
2. Press the [TEST] button twice.
3. Press the [Mode selection] button.
4. Press the [Mode selection] button and switch to the cooling (or heating) mode.
5. Press the [Fan speed] button.
6. Check operation of the outdoor unit fan.
7. Release test run by pressing the [ON/OFF] button.
8. Register a telephone number.

The telephone number of the repair shop, sales office, etc., to contact if an error occurs can be registered in the remote controller. The telephone number will be displayed when an error occurs. For registration procedures, refer to the operation manual for the indoor unit.

8.2.2. Using SW4 in outdoor unit

Refer to the outdoor unit installation manual.

8.3. Self-check (Wired remote controller) (Fig. 8-2)

1. Turn on the power.
2. Press the [CHECK] button twice.
3. Set refrigerant address with [TEMP] button if system control is used.
4. Press the [ON/OFF] button to stop the self-check.

*1 If the beeper does not sound again after the initial two beeps to confirm the self-check start signal was received and the OPERAATION INDICATOR lamp does not come on, there are no error records.

*2 If the beeper sounds three times continuously “beep, beep, beep (0.4 + 0.4 + 0.4 sec.)” after the initial two beeps to confirm the self-check start signal was received, the specified refrigerant address is incorrect.

- On wired remote controller
  Check code displayed in the LCD.

- If the unit cannot be operated properly after the above test run has been performed, refer to the following table to remove the cause.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>LED 1, 2 (PCB in outdoor unit)</th>

<td></td>
<td><em>Remote controller wire short</em></td>
</tr>
</tbody>
</table>

Note:
Operation is not possible for about 30 seconds after cancellation of function selection. (Correct operation)

For description of each LED (LED1, 2, 3) provided on the indoor controller, refer to the following table.

- LED 1 (power for microcomputer): Indicates whether control power is supplied. Make sure that this LED is always lit.
- LED 2 (power for remote controller): Indicates whether power is supplied to the remote controller. This LED lights only in the case of the indoor unit which is connected to the outdoor unit refrigerant address “0”.
- LED 3 (communication between indoor and outdoor units): Indicates state of communication between the indoor and outdoor units. Make sure that this LED is always blinking.

8.4. Check of drainage
- During the trial run, ensure the water is being properly drained out and that no water is leaking from joints.
- Always check this during installation even if the unit is not required to provide cooling/drying at that time.
9. Easy maintenance function

By using the maintenance mode, you can display many types of maintenance data on the remote controller such as the heat exchanger temperature and compressor current consumption for the indoor and outdoor units.

During air conditioner operation, data can be checked during either normal operation or maintenance mode stable operation.

* This function cannot be used during the test run.

* The availability of this function depends on the connecting outdoor unit. Refer to the brochures.

**Maintenance mode operation procedures**

1. Press the **TEST** button for three seconds to activate the maintenance mode.

2. Press the TEMP buttons to set the refrigerant address.

3. Select the data you want to display.

4. Press the **FILTER** button.

5. The data is displayed in C.

   - Indoor unit information
   - Outdoor unit information
   - Compressor information

   * The filter operation time displayed is the number of hours the filter has been used since the filter reset was performed.

6. Press the **TEST** button for three seconds or press the **ON/OFF** button to deactivate the maintenance mode.

**Stable operation**

Using the maintenance mode, the operation frequency can be fixed and the operation can be stabilized. If the air conditioner is stopped, use the following procedure to start this operation.

- Press the **MODE** button to select the operation mode.
- Press the **FILTER** button.

* You can check the data using steps (3) to (5) of the maintenance mode operation procedures while waiting for the stable operation.

**Display example (Comp discharge temperature 64 °C)**

- **Indoor unit information**
- **Outdoor unit information**
- **Compressor information**

- **Display example (Airflow temperature display example)**

- **Display example (Waiting for response)**

- **Display example (Stable operation)**

- **Display example (Stable operation cancellation)**
Please be sure to put the contact address/telephone number on this manual before handing it to the customer.
