1. Safety precautions

1.1. Before installation and electric work

Before installing the unit, make sure you read all the “Safety precautions”.

The “Safety precautions” provide very important points regarding safety. Make sure you follow them.

Symbols used in the text

⚠️ Warning:

Describes precautions that should be observed to prevent danger of injury or death to the user.

⚠️ Caution:

Describes precautions that should be observed to prevent damage to the unit.

Symbols used in the illustrations

⚠️ : Indicates an action that must be avoided.

⚠️ #: Indicates that important instructions must be followed.

⚠️ !: Indicates a part which must be grounded.

⚠️ ▼: Indicates that caution should be taken with rotating parts. (This symbol is displayed on the main unit label.) <Color: Yellow>

⚠️ ❣: Beware of electric shock (This symbol is displayed on the main unit label.) <Color: Yellow>

⚠️ Warning: Carefully read the labels affixed to the main unit.

⚠️ Warning:

• Ask the dealer or an authorized technician to install the air conditioner.
  - Improper installation by the user may result in water leakage, electric shock, or fire.
• Install the air unit at a place that can withstand its weight.
  - Inadequate strength may cause the unit to fall down, resulting in injuries.
• Use the specified cables for wiring. Make the connections securely so that the outside force of the cable is not applied to the terminals.
  - Improper installation may cause the unit to topple and result in injury.
• Always use an air cleaner, humidifier, electric heater, and other accessories specified by Mitsubishi Electric.
  - Improper installation by the user may result in water leakage, electric shock, or fire.
• Never repair the unit. If the air conditioner must be repaired, consult the dealer.
  - If the unit is repaired improperly, water leakage, electric shock, or fire may result.
• Do not touch the heat exchanger fins.
  - Improper handling may result in injury.
• When handling this product, always wear protective equipment.
  - Gloves, full arm protection namely boiler suit, and safety glasses.
  - Improper handling may result in injury.
• If refrigerant gas leaks during installation work, ventilate the room.
  - If the refrigerant gas comes into contact with a flame, poisonous gases will be released.
• Install the air conditioner according to this Installation Manual.
  - If the unit is installed improperly, water leakage, electric shock, or fire may result.
• Have all electric work done by a licensed electrician according to “Electric Facility Engineering Standard” and “Interior Wire Regulations” and the instructions given in this manual and always use a special circuit.
  - If the power source capacity is inadequate or electric work is performed improperly, electric shock and fire may result.
• Keep the electric parts away from water (washing water etc.).
  - It might result in electric shock, catching fire or smoke.
• Securely install the outdoor unit terminal cover (panel).
  - If the terminal cover (panel) is not installed properly, dust or water may enter the outdoor unit and fire or electric shock may result.
• When installing and moving the air conditioner to another site, do not change the it with a refrigerant different from the refrigerant specified on the unit.
  - If a different refrigerant or air is mixed with the original refrigerant, the refrigerant cycle may malfunction and the unit may be damaged.
• If the air conditioner is installed in a small room, measures must be taken to prevent the refrigerant concentration from exceeding the safety limit even if the refrigerant should leak.
  - Consult the dealer regarding the appropriate measures to prevent the safety limit from being exceeded. Should the refrigerant leak and cause the safety limit to be exceeded, hazards due to lack of oxygen in the room could result.
• When moving and reinstalling the air conditioner, consult the dealer or an authorized technician.
  - If the air conditioner is installed improperly, water leakage, electric shock, or fire may result.
• After completing installation work, make sure that refrigerant gas is not leaking.
  - If the refrigerant gas leaks and is exposed to a fan heater, stove, oven, or other heat source, it may generate noxious gases.
• Do not reconstruct or change the settings of the protection devices.
  - If the pressure switch, thermal switch, or other protection device is shorted and operated forcibly, or parts other than those specified by Mitsubishi Electric are used, fire or explosion may result.
  - To dispose of this product, consult your dealer.
• Do not use a leak detection additive.

1.2. Precautions for devices that use R410A refrigerant

⚠️ Caution:

• Do not use the existing refrigerant piping.
  - The old refrigerant and refrigerator oil in the existing piping contains a large amount of chlorine which may cause the refrigerant oil of the new unit to deteriorate.
• Use refrigerant piping made of C1220 (Cu-DHP) phosphorus deoxidized copper as specified in the JIS H3300 “Copper and copper alloy seamless pipes and tubes". In addition, be sure that the inner and outer surfaces of the pipes are clean and free of hazardous sulphur, oxides, dust/dirt, shaving particles, oils, moisture, or any other contaminant.
  - If dust, dirt, or water enters the refrigerant cycle, deterioration of the oil and compressor trouble may result.
• Use ester oil, ether oil or alkylbenzene (small amount) as the refrigerator oil to coat flares and flange connections.
  - The refrigerator oil will degrade if it is mixed with a large amount of mineral oil.
• Use liquid refrigerant to fill the system.
  - If gas refrigerant is used to seal the system, the composition of the refrigerant in the cylinder will change and performance may drop.
• Do not use a refrigerant other than R410A.
  - If another refrigerant (R22, etc.) is used, the chlorine in the refrigerant may cause the refrigerant oil to deteriorate.
• Use a vacuum pump with a reverse flow check valve.
  - The vacuum pump oil may flow back into the refrigerant cycle and cause the refrigerant oil to deteriorate.
• Do not use the following tools that are used with conventional refrigerants.
  (Gauge manifold, charge hose, gas leak detector, reverse flow check valve, refrigerant charge base, vacuum gauge, refrigerant recovery equipment)
  - If the conventional refrigerant and refrigerant oil are mixed in the R410A, the refrigerant may deteriorated.
  - If water is mixed in the R410A, the refrigerant oil may deteriorate.
  - Since R410A does not contain any chlorine, gas leak detectors for conventional refrigerants will not react to it.
• Do not use a charging cylinder.
  - Using a charging cylinder may cause the refrigerant to deteriorate.
• Be especially careful when managing the tools.
  - If dust, dirt, or water gets in the refrigerant cycle, the refrigerant may deteriorate.

1.3. Before getting installed

Caution:
• Do not install the unit where combustible gas may leak.
  - If the gas leaks and accumulates around the unit, an explosion may result.
• Do not use the air conditioner where food, pets, plants, precision instruments, or artwork are kept.
  - The quality of the food, etc. may deteriorate.
• Do not use the air conditioner in special environments.
  - Oil, steam, sulfuric smoke, etc. can significantly reduce the performance of the air conditioner or damage its parts.
• When installing the unit in a hospital, communication station, or similar place, provide sufficient protection against noise.
  - The inverter equipment, private power generator, high-frequency medical equipment, or radio communication equipment may cause the air conditioner to operate erroneously, or fail to operate. On the other hand, the air conditioner may affect such equipment by creating noise that disturbs medical treatment or image broadcasting.
• Do not install the unit on a structure that may cause leakage.
  - When the room humidity exceeds 80% or when the drain pipe is clogged, condensation may drip from the indoor unit. Perform collective drainage work together with the outdoor unit, as required.
• The indoor models should be installed the ceiling over than 2.5 m from floor.

1.4. Before getting installed (moved) - electrical work

Caution:
• Ground the unit.
  - Do not connect the ground wire to gas or water pipes, lightning rods, or telephone ground lines. Improper grounding may result in electric shock.

2. Indoor unit accessories

The unit is provided with the following accessories:

<table>
<thead>
<tr>
<th>No.</th>
<th>Accessories</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>①</td>
<td>Insulation pipe 25 mm small diameter</td>
<td>1</td>
</tr>
<tr>
<td>②</td>
<td>Insulation pipe 125 mm small diameter</td>
<td>1</td>
</tr>
<tr>

</tr>
</tbody>
</table>

3. Selecting an installation site

• Select a site with sturdy fixed surface sufficiently durable against the weight of unit.
• Before installing unit, the routing to carry in unit to the installation site should be determined.
• Select a site where the unit is not affected by entering air.
• Select a site where the flow of supply and return air is not blocked.
• Select a site where refrigerant piping can easily be led to the outside.
• Select a site which allows the supply air to be distributed fully in room.
• Do not install unit at a site with oil splashing or steam in much quantity.
• Do not install unit at a site where combustible gas may generate, flow in, stagnate or leak.
• Do not install unit at a site where equipment generating high frequency waves (a high frequency wave welder for example) is provided.
• At a distance 1 m or more away from your TV and radio (to prevent picture from being distorted or noise from being generated).
• In a place as far away as possible from fluorescent and incandescent lights (so the infrared remote control can operate the air conditioner normally).
• Do not install unit at a site where fire detector is located at the supply air side. (Fire detector may operate erroneously due to the heated air supplied during heating operation.)
• When special chemical product may scatter around such as site chemical plants and hospitals, full investigation is required before installing unit. (The plastic components may be damaged depending on the chemical product applied.)
• If the unit is run for long hours when the air above the ceiling is at high temperature/high humidity (due point above 26 °C), due condensation may be produced in the indoor unit. When operating the units in this condition, add insulation material (10-20 mm) to the entire surface of the indoor unit to avoid due condensation.
• Do not install the unit where ambient temperature exceeds 35°C [95°F] DB.

3.1. Install the indoor unit on a ceiling strong enough to sustain its weight

⚠️ Warning:
The unit must be securely installed on a structure that can sustain its weight. If the unit is mounted on an unstable structure, it may fall down causing injuries.

4. Fixing hanging bolts

4.1 Fixing hanging bolts

[Fig. 4.1.1] (P.2)

⑦ Center of gravity

(Give site of suspension strong structure.)

Hanging structure

- Ceiling: The ceiling structure varies from building to one another. For detailed information, consult your construction company.

</tr>
</tbody>
</table>

5. Installing the unit

5.1. Hanging the unit body

- Bring the indoor unit to an installation site as it is packed.
- To hang the indoor unit, use a lifting machine to lift and pass through the hanging bolts.

[Fig. 5.1.1] (P.2)

⑦ Unit body
⑧ Lifting machine

[Fig. 5.1.2] (P.2)

⑩ Nuts (field supply)
⑪ Washers (accessory)
⑫ M10 hanging bolt (field supply)

5.2. Transporting the heat exchanger unit and the fan unit separately

- Refer to the "Manipulation Details" label on the unit for how to separate the heat exchanger unit and the fan unit.

⚠️ Caution:
Heat exchanger unit and the fan unit cannot be installed in separate locations. Doing so will cause water leakage.

5.3. Confirming the unit’s position and fixing hanging bolts

- Use the gage supplied with the panel to confirm that the unit body and hanging bolts are positioned in place. If they are not positioned in place, it may result in dew drops due to wind leak. Be sure to check the positional relationship.
- Use a level to check that the surface indicated by ⑦ is at level. Ensure that the hanging bolt nuts are tightened to fix the hanging bolts.
- To ensure that drain is discharged, be sure to hang the unit at level using a level.

[Fig. 5.3.1] (P.2)

⑨ Indoor unit’s bottom surface

⚠️ Caution:
Install the unit in horizontal position. If the side with drain port is installed higher, water leakage may be caused.

6. Refrigerant pipe and drain pipe specifications

To avoid dew drops, provide sufficient antisweating and insulating work to the refrigerant and drain pipes. When using commercially available refrigerant pipes, be sure to wind commercially available insulating material (with a heat-resisting temperature of more than 100 °C and thickness given below) onto both liquid and gas pipes. Insulate all indoor pipes with form polyethylene insulation with a minimum density of 0.03 and a thickness as specified in the table below.

<table>
<thead>
<tr>
<th>Pipe size</th>
<th>Insulating material’s thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4 mm to 25.4 mm</td>
<td>More than 10 mm</td>
</tr>
<tr>
<td>28.6 mm to 38.1 mm</td>
<td>More than 15 mm</td>
</tr>
</tbody>
</table>

① Select the thickness of insulating material by pipe size.
② If the unit is used on the highest story of a building and under conditions of high temperature and humidity, it is necessary to use pipe size and insulating material’s thickness more than those given in the table above.
③ If there are customer’s specifications, simply follow them.
6.1. Refrigerant pipe and drain pipe specifications

6.2. Refrigerant pipe, drain pipe

[Fig. 6.2.1] (P.2)

- Air inlet
- Refrigerant piping (liquid)
- Refrigerant piping (gas)
- Control box
- Drain pipe
- Air outlet

7. Connecting refrigerant pipes and drain pipes

7.1. Refrigerant piping work

This piping work must be done in accordance with the installation manuals for both outdoor units.

- For constraints on pipe length and allowable difference of elevation, refer to the outdoor unit manual.
- The method of pipe connection is brazing connection.

**Caution:**

- Install the refrigerant piping for the indoor unit in accordance with the following.

1. Cut the tip of the indoor unit piping, remove the gas, and then remove the brazed cap.

2. Pull out the thermal insulation on the site refrigerant piping, braze the unit piping, and replace the insulation in its original position.

Wrap the piping with insulating tape.

**Note:**

- When blazing the refrigerant pipes, be sure to blaze, after covering a wet cloth to the pipes of the units in order to prevent it from burning and shrinking by heat.

3. **Cool by a wet cloth**

- Pay strict attention when wrapping the copper piping since wrapping the piping may cause condensation instead of preventing it.

4. **Thermal insulation tubing (small)**

**Caution:**

- Pull out the thermal insulation on the refrigerant piping at the site, braze the piping, and replace the insulation in its original position.
- Take care to ensure that condensation does not form on exposed copper piping.

5. **Thermal insulation tubing (large)**

6. **Site refrigerant piping**

7. **Ensure that there are no gaps between the insulation and the main body.**

8. **Thermal insulation tubing (small) (supplied) 1**

9. **Ties (large) (supplied) 4**

10. **Ensure that there is no gap here. Place join upwards.**

11. **Thermal insulation tubing (medium) (supplied) 2**

12. **Thermal insulation**

13. **Pull**

14. **Flared pipe end**

15. **Wrap with damp cloth**

16. **Return to original position**

17. **Ensure that there is no gap here.**

**Cautions On Refrigerant Piping**

- Be sure to use non-oxidative brazing for brazing to ensure that no foreign matter or moisture enter into the pipe.
- Be sure to apply refrigerating machine oil over the flare connection seating surface and tighten the connection using a double spanner.
- Provide a metal brace to support the refrigerant pipe so that no load is imparted to the indoor unit end pipe. This metal brace should be provided 50 cm away from the indoor unit’s flare connection.

**Warning:**

- When installing and moving the unit, do not charge it with refrigerant other than the refrigerant specified in the unit.

**Caution:**

- Use refrigerant piping made of C1220 (Cu-DHP) phosphorus deoxidized copper as specified in the JIS H3300 "Copper and copper alloy seamless pipes and tubes". In addition, be sure that the inner and outer surfaces of the pipes are clean and free of hazardous sulphur, oxides, dust/dirt, shaving particles, oils, moisture, or any other contaminant.
- Never use existing refrigerant piping.
- - The large amount of chlorine in conventional refrigerant and refrigerator oil in the existing piping will cause the new refrigerant to deteriorate.
- Store the piping to be used during installation indoors and keep both ends of the piping sealed until just before brazing.
- - If dust, dirt, or water gets into the refrigerant cycle, the oil will deteriorate and the compressor may fail.

7.2. Drain piping work

- Ensure that the drain piping is downward (pitch of more than 1/100) to the outdoor (discharge) side. Do not provide any trap or irregularity on the way.
- Ensure that any cross-wise drain piping is less than 20 m (excluding the difference of elevation). If the drain piping is long, provide metal braces to prevent it from waving. Never provide any air vent pipe. Otherwise drain may be ejected.
- Use a hard vinyl chloride pipe O.D. ø32 for drain piping.
- Ensure that collected pipes are 10 cm lower than the unit body’s drain port.
- Do not provide any odor trap at the drain discharge port.
- Put the end of the drain piping in a position where no odor is generated.
- Do not put the end of the drain piping in any drain where ionic gases are generated.

**[Fig. 7.2.1] (P.3)**

- Downward slope 1/100 or more
- Drain hose (Accessory)
- Indoor unit
- Collective piping
- Maximize this length to approx. 10 cm

1. Insert the drain hose (accessory) into the drain port.

2. Attach the drain pipe (O.D. ø32 PVC TUBE, field supply).

3. Perform insulation work on the drain pipe (O.D. ø32 PVC TUBE) and on the socket (including elbow).

**[Fig. 7.2.2] (P.3)**

- Indoor unit
- Insulation pipe (short) (accessory)
- Tie band (accessory)
- Band fixing part
- Insertion margin
- Drain hose (accessory)
- Drain pipe (O.D. ø32 PVC TUBE, field supply)
- Insulating material (field supply)
- Max.145 ± 5 mm
8. Duct work

- When connecting ducts, insert a canvas duct between the main body and the duct.
- Use non-combustible duct components.
- Install sufficient thermal insulation to prevent condensation forming on outlet duct flanges and outlet ducts.

⚠️ Caution:
- Keep the distance between the inlet grille and the fan over 850 mm. If it is less than 850 mm, install a safety guard not to touch the fan.

9. Electrical wiring

Precautions on electrical wiring

⚠️ Warning:
Electrical work should be done by qualified electrical engineers in accordance with “Engineering Standards For Electrical Installation” and supplied installation manuals. Special circuits should also be used. If the power circuit lacks capacity or has an installation failure, it may cause a risk of electric shock or fire.

1. Be sure to install an earth leakage breaker to the power.
2. Install the unit to prevent that any of the control circuit cables (remote controller, transmission cables) is brought in direct contact with the power cable outside the unit.
3. Ensure that there is no slack on all wire connections.
4. Some cables (power, remote controller, transmission cables) above the ceiling may be bitten by mouses. Use as many metal pipes as possible to insert the cables into them for protection.
5. Never connect the power cable to leads for the transmission cables. Otherwise the cables would be broken.
6. Be sure to connect control cables to the indoor unit, remote controller, and the outdoor unit.
7. Put the unit to the ground on the outdoor unit side.

2. Remote controller cables

<table>
<thead>
<tr>
<th>Types of cables</th>
<th>MA remote controller</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sheathed 2-core cable (unshielded) CVV</td>
<td></td>
</tr>
<tr>
<td>Cable diameter</td>
<td>0.3 to 1.25 mm²</td>
</tr>
<tr>
<td>Length</td>
<td>Less than 500 m</td>
</tr>
</tbody>
</table>

9.1. Power supply wiring

- Power supply cords of appliances shall not be lighter than design 245 IEC 57 or 227 IEC 57.
- A switch with at least 3 mm contact separation in each pole shall be provided by the Air conditioner installation.

Power cable size: more than 2.0 mm²

[Fig. 9.1.1] (P.4)

- Switch 16 A
- Overcurrent protection 16 A
- Indoor unit

[Selecting non-fuse breaker (NF) or earth leakage breaker (NV)]

To select NF or NV instead of a combination of Class B fuse with switch, use the following:
- In the case of Class B fuse rated 15 A or 20 A,
  - NF model name (MITSUBISHI): NF30-CS (15 A) (20 A)
  - NV model name (MITSUBISHI): NV30-CA (15 A) (20 A)
Use an earthing leakage breaker with a sensitivity of less than 30 mA 0.1 s.

⚠️ Caution:
Do not use anything other than the correct capacity breaker and fuse. Using fuse, wire or copper wire with too large capacity may cause a risk of malfunction or fire.

9.2. Connecting remote controller, indoor and outdoor transmission cables

⚠️ Warning:
- The compressor will not operate unless the indoor/outdoor transmission phase connection is correct.
- The connection wiring between the outdoor and indoor units can be extended up to a maximum of 50 meters, and the total extension including the crossover wiring between rooms is a maximum of 80 m.
- Connect indoor unit TB4 and terminal block for indoor-outdoor transmission line. (polar 3-core)
  - Cable 3-core 1.5 mm², in conformity with design 245 IEC 57.
- Install a remote controller following the manual supplied with the remote controller.
- Connect the “1” and “2” on indoor unit TB15 to a MA remote controller. (Non-polarized 2-wire)
- Connect the remote controller’s transmission cable within 10 m using a 0.75 mm² core cable. If the distance is more than 10 m, use a 1.25 mm² 3-junction cable.

[Fig. 9.2.1] (P.4) MA Remote controller

- Terminal block for indoor transmission cable

- Remote Controller
- TB4
9.3. Connecting electrical connections

Please identify the model name of the operation manual attached on the terminal bed box cover with that shown on the rating name plate.

1. Remove the screw (2pcs) holding the cover to dismount the cover.
   [Fig. 9.3.1] (P.4)
   • Screw holding cover (2pcs) ➔ Cover

2. Open knockout holes
   (Recommend to use a screwdriver or the like for this work.)
   [Fig. 9.3.2] (P.4)
   • Terminal bed box ➔ Knockout hole
   • Remove

3. Fix power source wiring to terminal bed box by using buffer bushing for tensile force. (PG connection or the like.) Connect transmission wiring to transmission terminal bed through the knockout hole of terminal bed box using ordinary bushing.

4. Connect the power source, Earth, transmission and remote controller wiring. The dismounting of the terminal bed box is not needed.
   [Fig. 9.3.3] (P.5)
   • Use PG bushing to keep the weight of the cable and external force from being applied to the power supply terminal connector. Use a cable tie to secure the cable. Wind the wire around the cable strap once to keep it from being pulled out.
   • Power source wiring ➔ Tensile force
   • Use ordinary bushing
   • Power source terminal bed ➔ Terminal bed for indoor transmission
   • Terminal bed for remote controller ➔ To 1-phase power source
   • Transmission line ➔ Transmission line to the remote controller
   • Terminal bed for outdoor transmission line
   • Transmission line to the remote controller

[Terminal bed connection]
[Fig. 9.3.4] (P.5)
• Terminal bed ➔ Round terminal
• Transmission cable (polar)

5. After wiring is complete, make sure again that there is no slack on the connections, and attach the cover onto the terminal bed box in the reverse order of removal.

Notes:
- Do not pinch the cables or wires when attaching the terminal bed box cover. Doing so may cause a risk of disconnection.
- When accommodating the terminal bed box, make sure that the connectors on the box side are not removed. If removed, it cannot operate normally.

9.4. Function settings (Function selection via the remote controller)

9.4.1 Function setting on the unit (Selecting the unit functions)

1) Changing the external static pressure setting [Fig. 9.4.1] (P.5)
   - Be sure to change the external static pressure setting depending on the duct and the grill used.
   ① Go to the function setting mode.
     Switch OFF the remote controller.
     Press the [⑥] and [⑧] buttons simultaneously and hold them for at least 2 seconds. FUNCTION will start to flash.
   ② Use the [⑥] button to set the refrigerant address (Ⅱ) to 00.
   ③ Press [⑥] and [+⑧] will start to flash in the unit number (Ⅲ) display.
   ④ Press the [⑥] button to set the unit number (Ⅲ) to 01-04 or AL.
   ⑤ Press the [⑦] MODE button to designate the refrigerant address/unit number. [+⑧] will flash in the mode number (Ⅰ) display momentarily.
   ⑥ Press the [⑥] and the current set setting number (Ⅰ) will flash. Use the [⑥] button to set the number in the setting number response to the external static pressure to be used.

<table>

   ⑦ Press the MODE button [⑦] and the setting number (Ⅰ) and (Ⅱ) will change to being on constantly and the contents of the setting can be confirmed.
   ⑧ Press the FILTER [⑥] and TEST RUN [⑥] buttons simultaneously for at least two seconds. The function selection screen will disappear momentarily and the air conditioner OFF display will appear.

2) Other functions
   ① Select unit number 00 for the settings. (Settings for all indoor units)
     Refer to Function table 1.
   ② Select unit number 01 to 04 or AL for the settings. (Settings for each indoor unit)
     To set the indoor unit in the individual system, select unit number 01.
     To set each indoor unit of two, three or four indoor units, which are connected when these units are simultaneously in operation, select unit number 01 to 04.
     To set all indoor units of two, three or four indoor units which are connected when these units are simultaneously in operation, select AL.
     Refer to Function table 2.

*1 When the power supply returns, the air conditioner will start 3 minutes later.

Note: When the function of an indoor unit were changed by function selection after the end of installation, always indicate the contents by entering a ✓ or other mark in the appropriate check filed of the tables.
9.5. Before test run

- After completing installation and the wiring and piping of the indoor and outdoor units, check for refrigerant leakage, looseness in the power supply or control wiring, wrong polarity, and no disconnection of one phase in the supply.
- Use a 500-volt megohmmeter to check that the resistance between the power supply terminals and ground is at least 1.0 MΩ.
- Do not carry out this test on the control wiring (low voltage circuit) terminals.

⚠️ Warning:
Do not use the air conditioner if the insulation resistance is less than 1.0 MΩ.

Insulation resistance

After installation or after the power source to the unit has been cut for an extended period, the insulation resistance will drop below 1 MΩ due to refrigerant accumulating in the compressor. This is not a malfunction. Perform the following procedures.

1. Remove the wires from the compressor and measure the insulation resistance of the compressor.
2. If the insulation resistance is below 1 MΩ, the compressor is faulty or the resistance dropped due to accumulation of refrigerant in the compressor.
3. After connecting the wires to the compressor, the compressor will start to warm up after power is supplied. After supplying power for the times indicated below, measure the insulation resistance again.
   - The insulation resistance drops due to accumulation of refrigerant in the compressor. The resistance will rise above 1 MΩ after the compressor is warmed up for two to three hours. (The time necessary to warm up the compressor varies according to atmospheric conditions and refrigerant accumulation.)
   - To operate the compressor with refrigerant accumulated in the compressor, the compressor must be warmed up at least 12 hours to prevent breakdown.
4. If the insulation resistance rises above 1 MΩ, the compressor is not faulty.

⚠️ Caution:
- The compressor will not operate unless the indoor/outdoor transmission phase connection is correct.
- Turn on the power at least 12 hours before starting operation.
- Starting operation immediately after turning on the main power switch can result in severe damage to internal parts. Keep the power switch turned on during the operational season.

9.6. Test run

9.6.1. Using wired remote controller

1. Turn on the power at least 12 hours before the test run.
2. Press the [TEST] button twice. ➡ “TEST RUN” liquid crystal display
3. Press the [Mode selection] button. ➡ Make sure that wind is blown out.
4. Press the [Mode selection] button and switch to the cooling (or heating) mode. ➡ Make sure that cold (or warm) wind is blown out.
5. Press the [Fan speed] button. ➡ Make sure that the wind speed is switched.
6. Check operation of the outdoor unit fan.
7. Release test run by pressing the [ON/OFF] button. ➡ Stop
8. Register a telephone number.
   The telephone number of the repair shop, sales office, etc., to contact if an error occurs can be registered in the remote controller. The telephone number will be displayed when an error occurs. For registration procedures, refer to the operation manual for the indoor unit.

- Set temperature button
- Mode selection button
- Fan speed button
- TEST button

9.7. Self-check

9.7.1. Wired remote controller

1. Turn on the power.
2. Press the [CHECK] button twice.
3. Set refrigerant address with [TEMP] button if system control is used.
4. Press the [ON/OFF] button to stop the self-check.

[Fig. 9.4.3] (P.5)

- CHECK button
- Refrigerant address
- TEMP button

For wired remote controller

1. Check code displayed in the LCD.
This product is designed and intended for use in the residential, commercial and light-industrial environment.

The product at hand is based on the following EU regulations:

- Low Voltage Directive 2006/95/EC

Please be sure to put the contact address/telephone number on this manual before handing it to the customer.
