OUTDOOR UNIT
PUHZ-RP250YHM-A

For use with R410A

INSTALLATION MANUAL
For safe and correct use, please read this installation manual thoroughly before installing the air-conditioner unit.

- **A**: Service port
  - For vacuuming in the refrigerant pipes on the site.
  - (Tightening torque 1.2 Nm)
- **B**: Shaft
  - Fully closed at the factory. When connecting the piping, and when vacuuming.
  - Open fully after these operations are completed.
  - **<When opening>**
    - Turn the shaft counterclockwise with a hexagonal wrench.
    - Turn around the shaft until it stops.
  - **<When closing>**
    - Turn the shaft clockwise with a hexagonal wrench.
    - Turn around the shaft until it stops.
- **C**: Flare nut
  - Coat the flare contact surface with refrigerating machine oil (small amount of ester oil, ether oil, or alkyl benzene) and tighten the nut with a double-ended wrench (refer to the following table for tightening torque).
- **D**: Cap
  - Remove the cap before operating the shaft. Be sure to return it to the original position after completing the operation.
- **E**: Packing
  - Coat both sides of the packing with machine refrigerating oil (small amount of ester oil, ether oil, or alkyl benzene) and tighten the flange.
  - (Tightening torque 25 Nm)
- **F**: Connecting pipe (accessory)
  - Be sure to remove the connecting pipe from the valve and braze it outside the unit.
- **G**: Field piping
  - Braze to the connecting pipe with unoxidized brazing.

1. Safety precautions

1.1. Before installation and electric work

- Before installing the unit, make sure you read all the “Safety precautions”.
- The “Safety precautions” provide very important points regarding safety. Make sure you follow them.

Symbols used in the text

![Warning:]
Describes precautions that should be observed to prevent danger of injury or death to the user.

![Caution:]
Describes precautions that should be observed to prevent damage to the unit.

Symbols used in the illustrations

- Indicates an action that must be avoided.
- Indicates that important instructions must be followed.
- Indicates a part which must be grounded.
- Beware of electric shock. (This symbol is displayed on the main unit label.) <Color: yellow>

**Warning:**
Carefully read the labels affixed to the main unit.

**HIGH VOLTAGE WARNING:**
- Control box houses high-voltage parts.
- When opening or closing the front panel of the control box, do not let it come into contact with any of the internal components.
- Before inspecting the inside of the control box, turn off the power, keep the unit off for at least 10 minutes, and confirm that the voltage between FT-P and FT-N on INV Board has dropped to DC20V or less. (It takes about 10 minutes to discharge electricity after the power supply is turned off.)

**Warning:**
- Ask the dealer or an authorized technician to install the air conditioner.
- Improper installation by the user may result in water leakage, electric shock, or fire.
- Install the unit at a place that can withstand its weight.
- Failure to do so may cause the unit to fall down, resulting in injuries and damage to the unit.
- Use the specified cables for wiring. Make the connections securely so that the outside force of the cable is not applied to the terminals.
- Inadequate connection and fastening may generate heat and cause a fire.
- Prepare for strong winds and earthquakes and install the unit at the specified place.
- Improper installation may cause the unit to topple and result in injury and damage to the unit.
- Always use filters and other accessories specified by Mitsubishi Electric.
- Ask an authorized technician to install the accessories. Improper installation by the user may result in water leakage, electric shock, or fire.
- Never repair the unit. If the air conditioner must be repaired, consult the dealer.
- If the unit is repaired improperly, water leakage, electric shock, or fire may result.
- Do not touch the heat exchanger fins.
- Improper handling may result in injury.
- If refrigerant gas leaks during installation work, ventilate the room.
- If the refrigerant gas comes into contact with a flame, poisonous gases will be released.
- Install the air conditioner according to this Installation Manual.
- If the unit is installed improperly, water leakage, electric shock, or fire may result.
- Have all electric work done by a licensed electrician according to “Electric Facility Engineering Standard” and “Interior Wire Regulations” and the instructions given in this manual and always use a dedicated power supply.
- If the power source capacity is inadequate or electric work is performed improperly, electric shock and fire may result.
- Securely install the outdoor unit terminal cover (panel).
- If the terminal cover (panel) is not installed properly, dust or water may enter the outdoor unit and fire or electric shock may result.
- When installing and moving the air conditioner to another site, do not charge it with a refrigerant different from the refrigerant specified on the unit.
- If a different refrigerant or air is mixed with the original refrigerant, the refrigerant cycle may malfunction and the unit may be damaged.
- If the air conditioner is installed in a small room, measures must be taken to prevent the refrigerant concentration from exceeding the safety limit if the refrigerant should leak.
- Consult the dealer regarding the appropriate measures to prevent the safety limit from being exceeded. Should the refrigerant leak and cause the safety limit to be exceeded, hazards due to lack of oxygen in the room could result.
- When moving and reinstalling the air conditioner, consult the dealer or an authorized technician.
- If the air conditioner is installed improperly, water leakage, electric shock, or fire may result.
- After completing installation work, make sure that refrigerant gas is not leaking.
- If the refrigerant gas leaks and is exposed to a fan heater, stove, oven, or other heat source, it may generate noxious gases.
- Do not reconstruct or change the settings of the protection devices.
- If the pressure switch, thermal switch, or other protection device is shorted or operated forcibly, or parts other than those specified by Mitsubishi Electric are used, fire or explosion may result.
- To dispose of this product, consult your dealer.
- The installer and system specialist shall secure safety against leakage according to local regulation or standards.
- The size of the wire and capacities of the switch for the main power supply are applicable if local regulations are not available.
- Pay special attention to the place of installation, such as a basement, etc. where refrigeration gas can accumulate, since refrigeration is heavier than the air.
- For outdoor units that allow fresh air intake to the indoor unit, the installation site must be carefully chosen because outdoor air can directly blow into the room when the thermostat is turned off.
- Direct exposure to outdoor air may have harmful effects on people or food.

1.2. Precautions for devices that use R410A refrigerant

**Caution:**
- Do not use existing refrigerant piping.
- The old refrigerant and refrigerant oil in the existing piping contains a large amount of chlorine which may cause the refrigerant oil of the new unit to deteriorate.
- R410A is a high-pressure refrigerant and can cause the existing piping to burst.
• Use refrigerant piping made of phosphorus deoxidized copper and copper alloy seamless pipes and tubes. In addition, be sure that the inner and outer surfaces of the pipes are clean and free of hazardous sulphur, oxides, dust/dirt, shaving particles, oils, moisture, or any other contami-
nant.
- Contaminants on the inside of the refrigerant piping may cause the refriger-
ant residual oil to deteriorate.
- If the piping to be used during installation indoors and keep both ends of the piping sealed until just before brazing. (Store elbows and other joints in a plastic bag.)
  - If dust, dirt, or water enters the refrigerant cycle, deterioration of the oil and compressor failure may result.
  - Appear a small amount of ester oil, ether oil, or alkyl benzene to flares. (for indoor unit)
    - Infiltration of a large amount of mineral oil may cause the refrigerant oil to deteriorate.
• Use liquid refrigerant to fill the system.
  - If gas refrigerant is used to fill the system, the composition of the refrigerant in the cylinder will change and performance may drop.
• Do not use a refrigerant other than R410A.
  - If another refrigerant (R22, etc.) is mixed with R410A, the chlorine in the refrigerant may cause the refrigerant oil to deteriorate.
  - Since R410A does not contain any chlorine, gas leak detectors for conven-
tional refrigerants will not react to it.
• Do not use the following tools that are used with conventional refriger-
ants.
  - Use a vacuum pump with a reverse flow check valve.
  - The vacuum pump oil may flow back into the refrigerant cycle and cause the refrigerator oil to deteriorate.
• Do not use the following tools that are used with conventional refriger-
ants.
  - (Gauge manifold, charge hose, gas leak detector, reverse flow check valve, refrigerant charge base, refrigerant recovery equipment)
  - If the conventional refrigerant and refrigerator oil are mixed in the R410A, the refrigerant may deteriorated.
  - If water is mixed in the R410A, the refrigerant oil may deteriorate.
  - Since R410A does not contain any chlorine, gas leak detectors for conven-
tional refrigerants will not react to it.
• Do not use a charging cylinder.
  - Using a charging cylinder may cause the refrigerant to deteriorate.
• Be especially careful when managing the tools.
  - If dust, dirt, or water gets into the refrigerant cycle, the refrigerant may dete-
riorate.

1.3. Before installation

Caution:
• Do not install the unit where combustible gas may leak.
  - If the gas leaks and accumulates around the unit, an explosion may result.
• Do not use the air conditioner where food, pets, plants, precision instru-
ments, or artwork are kept.
  - The quality of the food, etc. may deteriorate.
• Do not use the air conditioner in special environments.
  - Oil, steam, sulfuric smoke, etc. can significantly reduce the performance of the air conditioner or damage its parts.
• When installing the unit in a hospital, communication station, or similar place, provide sufficient protection against noise.
  - Inverter equipment, private power generator, high-frequency medical equip-
ment, or radio communication equipment may cause the air conditioner to operate erroneously, or fail to operate. On the other hand, the air conditioner may affect such equipment by creating noise that disturbs medical treatment or image broadcasting.
• Do not install the unit on a structure that may cause leakage.
  - When the room humidity exceeds 80% or when the drain pipe is clogged, condensation may drip from the indoor unit. Perform collective drainage work together with the outdoor unit, as required.

1.4. Before installation (relocation) - electric-
ical work

Caution:
• Ground the unit.
  - Do not connect the ground wire to gas or water pipes, lightning rods, or
  - Phone ground lines. Improper grounding may result in electric shock.
• Install the power cable so that it is not applied to the cable.
  - Tension may cause the cable to break and generate heat and cause a fire.
• Install a leak circuit breaker, as required.
  - If a leak circuit breaker is not installed, electric shock may result.
  - Use only a circuit breaker and fuse of the specified capacity.
    - A fuse or circuit breaker of a larger capacity, or the use of a substitute simple
    - Steel or copper wire may result in a general unit failure or fire.
• Do not wash the air conditioner units.
  - Washing them may cause an electric shock.
• Be careful that the installation base is not damaged by long use.
  - If the damage is left uncorrected, the unit may fall and cause personal injury
  - Or property damage.
• Install the drain piping according to this Installation Manual to ensure
  - Proper drainage. Wrap thermal insulation around the pipes to prevent
  - Condensation.
  - Improper drain piping may cause water leakage causing damage to furniture
  - And other possessions.
• Be very careful about transporting the product.
  - One person should not carry the product. Its weight is in excess of 20kg.
  - Some products use PP bands for packaging. Do not use any PP bands as a
  - Means of transportation. It is dangerous.
  - Do not touch the heat exchanger fins. Doing so may cut your fingers.
  - When transporting the outdoor unit, support it at the specified positions on
  - The unit base. Also support the outdoor unit at four points so that it cannot
  - Slip sideways.
• Safely dispose of the packing materials.
  - Packaging materials, such as nails and other metal or wooden parts, may cause
  - Stabs or other injuries.
  - Tear apart and throw away plastic packaging bags so that children will not
  - Play with them. If children play with a plastic bag which has not been torn
  - Apart, they face the risk of suffocation.

1.5. Before starting the test run

Caution:
• Turn on the power at least 12 hours before starting operation.
  - Starting operation immediately after turning on the main power switch can result in irreversible damage to internal parts. Keep the power switch turned on during the operational season. Make sure of the phase order of power supply and voltage between each phase.
• Do not touch the switches with wet fingers.
  - Touching a switch with wet fingers can result in an electric shock.
• Do not touch the refrigerant pipes during and immediately after opera-
tion.
  - During and immediately after operation, the refrigerant pipes may be hot or
cold, depending on the condition of the refrigerant flowing through the refrig-
erant piping, compressor, and other refrigerant cycle parts. Your hands may suffer burns or frostbite if you touch the refrigerant pipes.
• Do not operate the air conditioner with the panels and guards removed.
  - Rotating, hot, or high-voltage parts can cause injuries.
• Do not turn off the power immediately after stopping operation.
  - Always wait at least 5 minutes before turning off the power. Otherwise,
  - Drainage water leakage or mechanical failure of sensitive parts may occur.
• Do not touch the surface of the compressor during servicing.
  - If unit is connected to a supply and not running, the crank case heater located
  - At the base of the compressor may still be operating.

2. About the product

This unit uses R410A-type refrigerant.
• Piping for systems using R410A may be different from that for systems using conventional refrigerant because the design pressure in systems using R410A is higher. Refer to the Data Book for more information.
• Some of the tools and equipment used for installation with systems that use other types of refrigerant cannot be used with the systems using R410A. Refer to the Data Book for more information.
• Do not use the existing piping, as it contains chlorine, which is found in con-
ventional refrigerating machine oil and refrigerant. This chlorine will deteriorate the refrigerant machine oil in the new equipment. The existing piping must not be used as the design pressure in systems using R410A is higher than that in the systems using other types of refrigerant and the existing pipes may burst.

5. Space required around unit

1. In case of single installation
   - Secure enough space around the unit as shown in the figure on page 2.
   - When there is little space up to an obstruction
     - <A> Top view
     - <B> Side view
       - <C> When there is little space up to an obstruction
         - Front
         - Unit height
         - Back
         - Air outlet guide (Procured at the site)

2. In case of collective installation
   - When multiple units are installed adjacent to each other, secure enough space to allow for air circulation and walkway between groups of units as shown in the figures on page 2.
   - At least two sides must be left open.
   - As with the single installation, add the height that exceeds the height limit <h> to the figures that are marked with an asterisk.

6. Lifting method

- Use suspension ropes that will withstand the weight of the unit.
- When moving the unit, use a 4-point suspension, and avoid giving impacts to the unit (Do not use 2-point suspension).
- Place protective pads on the unit where it comes in contact with the ropes to protect the unit from being scratched.
- Set the angle of roping at 40° or less.
- Use 2 ropes that are each longer than 8 meters.
- Place protective padding at the corners of the product to protect the product from scratches or dents that might be caused by the rope.

7. Installation of unit

7.1. Installation

- M10 anchor bolt procured at the site.
- Corner is not seated.
- Fixing bracket for the hole-in anchor bolt (3 locations to fix with screws).
- Fix unit tightly with bolts so that unit will not fall down due to earthquakes or strong winds.
- Use concrete or an angle bracket as the foundation of unit.
- Vibration may be transmitted to the installation section and noise and vibration may be generated from the floor and walls, depending on the installation conditions. Therefore, provide ample vibrationproofing (cushion pads, cushion frame, etc.).
- Build the foundation in such way that the corner of the installation leg is securely supported as shown in the figure (Fig. 7.1.1).
- When using a rubber isolating cushion, please ensure it is large enough to cover the entire width of each of the unit’s legs. If the corners are not firmly seated, the installation feet may be bent.
- The projecting length of the anchor bolt should be less than 30 mm.
- Hole-in anchor bolts are not compatible with this product. However, if fixing brackets are mounted on the 4 locations of the unit attachment part, hole-in anchor bolts can be used.

Caution:
Be very careful when carrying/moving the product.
- When installing the outdoor unit, suspend the unit at the specified location of the unit base. Stabilize as necessary so that it does not move to the side and support it at 4 points. If the unit is installed or suspended with 3-point support, the unit may become unstable and fall.

Warning:
- Be sure to install unit in a place strong enough to withstand its weight. Any lack of strength may cause unit to fall down, resulting in a personal injury.
- Have installation work in order to protect against strong winds and earthquakes. Any installation deficiency may cause unit to fall down, resulting in a personal injury.

When building the foundation, give full attention to the floor strength, drain water disposal during operation, and piping and wiring routes.

Precautions when routing the pipes and wires below the unit
When routing the pipes and wires below the unit, be sure that the foundation and base work do not block the base through-holes. Also make sure the foundation is at least 100 mm high so that the piping can pass under the unit.
8. Refrigerant piping installation

The pipe is connected via a terminal-branch type connection in which refrigerant piping from the outdoor unit is branched at the terminal and is connected to each of the indoor units.

The method of pipe connection is as follows: flared connection for the indoor units, gas pipes for outdoor units, brazed connection; liquid pipes, flared connection. Note that the branched sections are brazed.

⚠️ Warning:
Always use extreme care to prevent the refrigerant gas from leaking while using fire or flame. If the refrigerant gas comes in contact with a flame from any source, such as a gas stove, it breaks down and generates a pois-sonous gas which can cause gas poisoning. Never weld in an unventilated room. Always conduct an inspection for gas leakage after installation of the refrigerant piping has been completed.

8.1. Caution
This unit uses refrigerant R410A. Follow the local regulations on materials and pipe thickness when selecting pipes. (Refer to the table below.)

1. Use the following materials for refrigeration piping.
   - Material: Use copper alloy seamless pipes made of phosphorus deoxi-dized copper. Ensure the inner and outer surfaces of the pipes are clean and free from hazardous sulfur, oxide, dusts, shaving particles, oils, and moisture (contamination).
   - Size: Refer to item 8.2. for detailed information on refrigerant piping sys-tem.

2. Commercially available piping often contains dust and other materials. Always blow it clean with a dry inert gas.

3. Use care to prevent dust, water or other contaminants from entering the piping during installation.

4. Reduce the number of bending portions as much as possible, and make bend-ing radii as big as possible.

</tbody>
</table>

* For pipe sized ø19.05 for R410A air conditioner, choice of pipe type is up to you.

5. Always observe the restrictions on the refrigerant piping (such as rated length, height difference, and piping diameter) to prevent equipment failure or a de-cline in heating/cooling performance.

6. Either a lack or an excess of refrigerant causes the unit to make an emergency stop. Charge the system with an appropriate amount of refrigerant. When serv-icing, always check the notes concerning pipe length and amount of additional refrigerant at both locations, the refrigerant volume calculation table on the back of the service panel and the additional refrigerant section on the labels for the combined number of indoor units (Refer to item 8.2. for detailed infor-mation on refrigerant piping system).

7. Be sure to charge the system using liquid refrigerant.

8. Never use refrigerant to perform an air purge. Always evacuate using a vacuum pump.

9. Always insulate the piping properly. Insufficient insulation will result in a de-cline in heating/cooling performance, water drops from condensation and other such problems (Refer to item 9.4 for thermal insulation of refrigerant piping).

10. When connecting the refrigerant piping, make sure the valve of the outdoor unit is completely closed (the factory setting) and do not operate it until the refrigerant piping for the outdoor and indoor units has been connected, a re-frigerant leakage test has been performed and the evacuation process has been com-pleted.

11. Braze only with non-oxide brazing material for piping. Failure to do so may damage the compressor. Be sure to perform the non-oxidation braz-ing with a nitrogen purge.

12. Do not use any commercially available anti-oxidizing agent since it may cause pipe corrosion and degrading of the refrigerant oil.

Please contact Mitsubishi Electric for more details.
(Refer to item 9.2. for details of the piping connection and valve operation)

Never perform outdoor unit piping connection work when it is raining.

⚠️ Warning:
When installing and moving the unit, do not charge the system with any other refrigerant other than the refrigerant specified on the unit.
- Mixing of a different refrigerant, air, etc. may cause the refrigerant cycle to mal-function and may result in severe damage.

⚠️ Caution:
- Use a vacuum pump with a reverse flow check valve.
  - If the vacuum pump does not have a reverse flow check valve, the vacuum pump oil may flow back into the refrigerant cycle and cause deterioration of the refrigerant oil.

- Do not use the tools shown below used with conventional refrigerant.
  (Gauge manifold, charge hose, gas leak detector, check valve, refrigerant charge base, vacuum gauge, refrigerant recovery equipment)
  - Mixing of conventional refrigerant and refrigerator oil may cause the refrig-erator oil to deteriorate.
  - Mixing of water will cause the refrigerant oil to deteriorate.
  - R410A refrigerant does not contain any chlorine. Therefore, gas leak detec-tors for conventional refrigerants will not react to it.
  - Manage the tools used for R410A more carefully than normal.
    - If dust, dirt, or water gets in the refrigerant cycle, the refrigerator oil will dete-riorate.
  - Never use existing refrigerant piping.
    - The large amount of chlorine in conventional refrigerant and refrigerator oil in the existing piping will cause the new refrigerant to deteriorate.
  - Never use refrigerant piping.
    - The large amount of chlorine in conventional refrigerant and refrigerator oil in the existing piping will cause the new refrigerant to deteriorate.
  - Store the piping to be used during installation indoors and keep both ends of the piping sealed until just before brazing.
    - If dust, dirt, or water gets into the refrigerant cycle, the oil will deteriorate and the compressor may fail.
  - Do not use a charging cylinder.
    - Using a charging cylinder may cause the refrigerant to deteriorate.
  - Do not use special detergents for washing piping.

8.2. Refrigerant piping system

[Fig. 8.2.1] (P3)

- Outdoor model
- Liquid pipe
- Gas pipe
- Outdoor unit
- Indoor unit
9. Additional refrigerant charge

At the time of shipping, the outdoor unit is charged with refrigerant. This charge does not include the amount needed for extended piping and additional charging of each refrigerant line will be required on site. In order that future servicing may be properly provided, always keep a record of the size and length of each refrigerant line and the amount of additional charge by writing it in the space provided on the outdoor unit.

9.1. Calculation of additional refrigerant charge

- Calculate the amount of additional charge based on the length of the piping extension and the size of the refrigerant line.
- Use the table below as a guide to calculating the amount of additional charging and charge the system accordingly.
- If the calculation results in a fraction of less than 0.1 kg, round up to the next 0.1 kg. For example, if the result of the calculation was 11.38 kg, round the result up to 11.4 kg.

<Additional Charge>

<table>
<thead>

<tbody>
<tr>
<td>ø9.52 = 0.06 mm</td>
<td></td>
</tr>
</tbody>
</table>
9.3. Airtight test, evacuation, and refrigerant charging

① Airtight test
Perform with the valve of the outdoor unit closed, and pressurize the connection piping and the indoor unit from the service port provided on the valve of the outdoor unit. (Always pressurize from both the liquid pipe and the gas pipe service ports.)

<table>
<thead>
<tr>
<th>Airtight test procedure</th>
<th>Restriction</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) After pressurizing to the design pressure (4.15 MPa) using nitrogen gas, allow it to stand for about one day. If the pressure does not drop, airtightness is good. However, if the pressure drops, since the leaking point is unknown, the following bubble test may also be performed. (2) After the pressurization described above, spray the flare connection parts, brazed parts, and other parts that may leak with a bubbling agent (Kyuboflex, etc.) and visually check for bubbles. (3) After the airtight test, wipe off the bubbling agent.</td>
<td>• If a flammable gas or air (oxygen) is used as the pressurization gas, it may catch fire or explode.</td>
</tr>
</tbody>
</table>

② Evacuation
Evacuate with the valve of the outdoor unit closed and evacuate both the connection piping and the indoor unit from the service port provided on the valve of the outdoor unit using a vacuum pump. (Always evacuate from the service port of both liquid pipe and gas pipe.) After the vacuum reaches 650 Pa [abs], continue evacuation for at least one hour or more. Then, stop the vacuum pump and leave it for 1 hour. Ensure the degree of vacuum has not increased. (If the degree of vacuum increase is larger than 130 Pa, water might have entered. Apply pressure to dry nitrogen gas up to 0.05 MPa and vacuum again.) Finally, seal in with the liquid refrigerant through the liquid pipe, and adjust the gas piping to obtain an appropriate amount of the refrigerant during operation.

* Never perform air purging using refrigerant.

③ Refrigerant charging
Since the refrigerant used with the unit is nonazeotropic, it must be charged in the liquid state. Consequently, when charging the unit with refrigerant from a cylinder, if the cylinder does not have a syphon pipe, charge the liquid refrigerant by turning the cylinder upside-down as shown in Fig. 9.3.3. If the cylinder has a syphon pipe like that shown in the picture on the right, the liquid refrigerant can be charged with the cylinder standing upright. Therefore, give careful attention to the cylinder specifications. If the unit should be charged with gas refrigerant, replace all the refrigerant with new refrigerant. Do not use the refrigerant remaining in the cylinder.

④ Syphon pipe
In case of the R410A cylinder having no syphon pipe.

9.4. Thermal insulation of refrigerant piping
Be sure to add insulation work to refrigerant piping by covering liquid pipe and gas pipe separately with enough thickness heat-resistant polyethylene, so that no gap is observed in the joint between indoor unit and insulating material, and insulating materials themselves. When insulation work is insufficient, there is a possibility of condensation drip, etc. Pay special attention to insulation work in the ceiling plenum.

- **Heat insulation material A**: Glass fiber + Steel wire
- **Glass fiber**: Adhesive + Heat-resistant polyethylene foam + Adhesive tape (Polyester)
- **Steel wire**: Nail, wire, etc.
- **Outer covering B**:
  - Indoor: Vinyl tape
  - Outdoor: Water-proof hemp cloth + Bronze asphalt

**Note:**
- When using polyethylene cover as covering material, asphalt roofing shall not be required.
- No heat insulation must be provided for electric wires.

**Penetrations**

- **<A> Inner wall (concealed)**
- **<B> Outer wall**
- **<C> Outer wall (exposed)**
- **<D> Floor (waterproofing)**
- **<E> Roof pipe shaft**
- **<F> Penetrating portion on fire limit and boundary wall**

**Insulation materials for the pipes to be added on site must meet the following specifications:**

<table>
<thead>
<tr>
<th>Pipe size</th>
<th>Thickness</th>
<th>Temperature Resistance</th>
</tr>
</thead>
<tbody>
<tr>
<td>ø6.35 to 25.4 mm</td>
<td>10 mm min.</td>
<td>100°C min.</td>
</tr>
<tr>
<td>ø28.58 to 41.28 mm</td>
<td>15 mm min.</td>
<td></td>
</tr>
</tbody>
</table>

* Installation of pipes in a high-temperature high-humidity environment, such as the top floor of a building, may require the use of insulation materials thicker than the ones specified in the chart above.

* When certain specifications presented by the client must be met, ensure that they also meet the specifications on the chart above.
10. Wiring (For details, refer to the installation manual of each unit and controller.)

10.1. Caution

① Follow ordinance of your governmental organization for technical standard related to electrical equipment, wiring regulations and guidance of each electric power company.
② Wiring for control (hereinafter referred to as transmission line) shall be (5 cm or more) apart from power source wiring so that it is not influenced by electric noise from power source wiring (Do not insert transmission line and power source wire in the same conduit).
③ Be sure to provide designated grounding work to the to the outdoor unit.
④ Give some allowance to wiring for electrical part box of indoor and outdoor units, because the box is sometimes removed at the time of service work.
⑤ Never connect the main power source to terminal block of transmission line. If connected, electrical parts will burn out.
⑥ Use 2-core shield cable for transmission line. If transmission lines of different systems are wired with the same multipole core cable, the resultant poor transmitting and receiving will cause erroneous operations.
⑦ Only the transmission line specified should be connected to the terminal block for outdoor unit transmission. Erroneous connection does not allow the system to operate.

10.2. Control box and connecting position of wiring

① Outdoor unit

1. Remove the front panel of the control box by removing the 4 screws and pushing it up a little before pulling it out.
2. Connect the indoor - outdoor transmission line to the terminal block (TB3) for the indoor - outdoor transmission line. If multiple outdoor units are connected in the same refrigerant system, daisy-chain TB3 (M1, M2, ... Terminal) on the outdoor units. Connect the indoor - outdoor transmission line for the outdoor units to TB3 (M1, M2, ... Terminal) of only one of the outdoor units.
3. In the case of indoor-outdoor transmission line, connect the shield ground to the grounding terminal ( ).
4. Fix the connected wires securely in place with the cable strap at the bottom of the terminal block. External force applied to the terminal block may damage it resulting in a short circuit, ground fault, or a fire.

10.4. Wiring of main power supply and equipment capacity

Schematic Drawing of Wiring (Example)

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Model</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Outdoor unit</td>
</tr>
</tbody>
</table>

1. Use dedicated power supplies for the outdoor unit and indoor unit.
2. Bear in mind ambient conditions (ambient temperature, direct sunlight, rain water, etc.) when proceeding with the wiring and connections.
3. The wire size is the minimum value for metal conduit wiring. If the voltage drops, use a wire that is one rank thicker in diameter.
4. Make sure the power-supply voltage does not drop more than 10%.
5. Specific wiring requirements should adhere to the wiring regulations of the region.
6. Power supply cords of parts of appliances for outdoor use shall not be lighter than polyvinyl chloride sheathed flexible cable (design 245 IEC57). For example, use wiring such as Y2W.

**Warning:**
- Be sure to use specified wires for connections and ensure no external force is imparted to terminal connections. If connections are not fixed firmly, heating or fire may result.
- Be sure to use the appropriate type of overcurrent protection switch. Note that generated overcurrent may include some amount of direct current.

**Caution:**
- Some installation sites may require attachment of an earth leakage breaker for the inverter. If no earth leakage breaker is installed, there is a danger of electric shock.
- Do not use anything other than a breaker and fuse with the correct capacity. Using a fuse or wire of too large capacity may cause malfunction or fire.

| **Model** | **Ssc (MVA)** |

| RP250 | 1.27 |

Caution:
- Follow ordinance of your governmental organization for technical standard related to electrical equipment, wiring regulations and guidance of each electric power company.
- Wiring for control (hereinafter referred to as transmission line) shall be (5 cm or more) apart from power source wiring so that it is not influenced by electric noise from power source wiring (Do not insert transmission line and power source wire in the same conduit).
- Be sure to provide designated grounding work to the outdoor unit.
- Give some allowance to wiring for electrical part box of indoor and outdoor units, because the box is sometimes removed at the time of service work.
- Never connect the main power source to terminal block of transmission line. If connected, electrical parts will burn out.
- Use 2-core shield cable for transmission line. If transmission lines of different systems are wired with the same multipole core cable, the resultant poor transmitting and receiving will cause erroneous operations.
- Only the transmission line specified should be connected to the terminal block for outdoor unit transmission. Erroneous connection does not allow the system to operate.

10.3. Wiring transmission cables

① Types of control cables
1. Wiring transmission cables
   - Types of transmission cables: Shielding wire CVVS, CPEVS or MVVS
   - Cable diameter: More than 1.25 mm²
   - Maximum wiring length: Within 80 m
2. Remote control cables
   - Remote Controller
     - Kind of remote control cable
       - Sheathed 2-core cable (unshielded) CVV
     - Cable diameter
       - 0.3 to 1.25 mm² (0.75 to 1.25 mm²)
     - Remarks
       - Connected with simple remote controller.
② Wiring examples
   - Controller name and symbol.
   - Maximum wiring length: Within 80 m
   - *Connected with simple remote controller.

**Examples of transmission cable wiring:**

11. Test run

11.1. The following phenomena do not represent faults.

<table>
<thead>
<tr>
<th>Phenomenon</th>
<th>Display of remote controller</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fan setting changes during heating.</td>
<td>Normal display</td>
<td>Ultra-low speed operation is commenced at thermostat OFF. Light air automatically changes over to set value by time or piping temperature at thermostat ON.</td>
</tr>
<tr>
<td>Fan stops during heating operation.</td>
<td>Defrost display</td>
<td>The fan is to stop during defrosting.</td>
</tr>
<tr>
<td>Fan does not stop while operation has been stopped.</td>
<td>No lighting</td>
<td>The fan is set to run for 1 minute after stopping to exhaust residual heat (only in heating).</td>
</tr>
<tr>
<td>No setting of fan while start SW has been turned on.</td>
<td>Heat ready</td>
<td>Ultra low-speed operation for 5 minutes after SW ON or until piping temperature becomes 35°C, low speed operation for 2 minutes thereafter, and then set notch is commenced (Hot adjust control).</td>
</tr>
<tr>
<td>Indoor unit remote controller shows “H0” or “PLEASE WAIT” indicator for about five minutes when turning ON universal power supply.</td>
<td>“H0” or “PLEASE WAIT” flashes</td>
<td>The system is being started up. Operate remote controller again after “H0” or “PLEASE WAIT” disappear.</td>
</tr>
<tr>
<td>Indoor unit emits noise when switching from heating to cooling and vice versa.</td>
<td>Normal display</td>
<td>This is a switching sound of the refrigerant circuit and does not imply a problem.</td>
</tr>
<tr>
<td>Immediately after startup, the indoor unit emits the sound of the refrigerant flow.</td>
<td>Normal display</td>
<td>Unstable flow of the refrigerant emits a sound. This is temporary and does not imply a problem.</td>
</tr>
<tr>
<td>Warm air comes from an indoor unit that is not performing a heating operation.</td>
<td>Normal display</td>
<td>The LEV is slightly open to prevent refrigerant, of the indoor unit that is not performing the heating operation, from being liquefied. This does not imply a problem.</td>
</tr>
