1. Safety precautions

1.1. Before installation and electric work

- Before installing the unit, make sure you read all the "Safety precautions".
- The "Safety precautions" provide very important points regarding safety. Make sure you follow them.

Symbols used in the text

⚠️ Warning: Describes precautions that should be observed to prevent injury or death to the user.

⚠️ Caution: Describes precautions that should be observed to prevent damage to the unit.

Symbols used in the illustrations

📝: Indicates an action that must be avoided.
➡️: Indicates that important instructions must be followed.
نطق: Indicates a part which must be grounded.
⚠️: Indicates that caution should be taken with rotating parts. (This symbol is displayed on the main unit label.) <Color: Yellow>
⚠️: Beware of electric shock (This symbol is displayed on the main unit label.)<Color: Yellow>

⚠️ Warning: Carefully read the labels affixed to the main unit.

- When handling this product, always wear protective equipment.
  - EG: Gloves, full arm protection namely boiler suit, and safety glasses.
  - Improper handling may result in injury.
- If refrigerant gas leaks during installation work, ventilate the room.
  - If the refrigerant gas comes into contact with a flame, poisonous gases will be released.
- Install the air conditioner according to this Installation Manual.
  - If the unit is installed improperly, water leakage, electric shock, or fire may result.
- Have all electric work done by a licensed electrician according to "Electric Facility Engineering Standard" and "Interior Wire Regulations" and the instructions given in this manual and always use a special circuit.
  - If the power source capacity is inadequate or electric work is performed improperly, electric shock and fire may result.
- Keep the electric parts away from water (washing water etc.).
  - It might result in electric shock, catching fire or smoke.
- Securely install the outdoor unit terminal cover (panel).
  - If the terminal cover (panel) is not installed properly, dust or water may enter the outdoor unit and fire or electric shock may result.
- Do not use refrigerant other than the type indicated in the manuals provided with the unit and on the nameplate.
  - Doing so may cause the unit or pipes to burst, or result in explosion or fire during use, during repair, or at the time of disposal of the unit.
  - It may also be in violation of applicable laws.
  - MITSUBISHI ELECTRIC CORPORATION cannot be held responsible for malfunctions or accidents resulting from the use of the wrong type of refrigerant.
- If the air conditioner is installed in a small room, measures must be taken to prevent the refrigerant concentration from exceeding the safety limit.
  - Consult the dealer regarding the appropriate measures to prevent the safety limit from being exceeded. Should the refrigerant leak and cause the safety limit to be exceeded, hazards due to lack of oxygen in the room could result.
- When moving and reinstalling the air conditioner, consult the dealer or an authorized technician.
  - If the air conditioner is installed improperly, water leakage, electric shock, or fire may result.
- After completing installation work, make sure that refrigerant gas is not leaking.
  - If the refrigerant gas leaks and is exposed to a fan heater, stove, oven, or other heat source, it may generate noxious gases.
  - Do not reconstruct or change the settings of the protection devices.
  - If the pressure switch, thermal switch, or other protection device is shortened and operated forcibly, or parts other than those specified by Mitsubishi Electric are used, fire or explosion may result.
  - To dispose of this product, consult your dealer.
  - Do not use a leak detection additive.
- The installer and system specialist shall secure safety against leakage according to local regulation or standards.
  - Following standards may be applicable if local regulation are not available.
  - Pay a special attention to the place, such as a basement, etc. where refrigeration gas can stay, since refrigeration is heavier than the air.
  - Children should be supervised to ensure that they do not play with the appliance.
1.2. Precautions for devices that use R410A refrigerant

**Caution:**
- Do not use the existing refrigerant piping.
  - The old refrigerant and refrigerant oil in the existing piping contains a large amount of chlorine which may cause the refrigerant oil of the new unit to deteriorate.
- Use refrigerant piping made of C1220 (Cu-DHP) phosphorus deoxidized copper as specified in the JIS H3300 "Copper and copper alloy seamless pipes and tubes". In addition, be sure that the inner and outer surfaces of the pipes are clean and free of hazardous sulphur, oxides, dust/dirt, shaving particles, oils, moisture, or any other contaminant.
- Contaminants on the inside of the refrigerant piping may cause the refrigerant residual oil to deteriorate.
- Store the piping to be used during installation indoors and keep both ends of the piping sealed until just before brazing. (Store elbows and other joints in a plastic bag.)
- If dust, dirt, or water enters the refrigerant cycle, deterioration of the oil and compressor trouble may result.
- Use ester oil, ether oil or alkylbenzene (small amount) as the refrigerant oil to coat flares and flange connections.
  - The refrigerant oil will degrade if it is mixed with a large amount of mineral oil.
- Use liquid refrigerant to fill the system.
  - If gas refrigerant is used to seal the system, the composition of the refrigerant in the cylinder will change and performance may drop.
- Do not use a refrigerant other than R410A.
  - If another refrigerant (R22, etc.) is used, the chlorine in the refrigerant may cause the refrigerant oil to deteriorate.
- Use a vacuum pump with a reverse flow check valve.
  - The vacuum pump oil may flow back into the refrigerant cycle and cause the refrigerant oil to deteriorate.
- Do not use the following tools that are used with conventional refrigerants.
  - Gauge manifold, charge hose, gas leak detector, reverse flow check valve, refrigerant charge base, vacuum gauge, refrigerant recovery equipment)
  - If the conventional refrigerant and refrigerant oil are mixed in the R410A, the refrigerant may deteriorate.
- If water is mixed in the R410A, the refrigerant oil may deteriorate.
- Since R410A does not contain any chlorine, gas leak detectors for conventional refrigerants will not react to it.
- Do not use a charging cylinder.
  - Using a charging cylinder may cause the refrigerant to deteriorate.
- Be especially careful when managing the tools.
  - If dust, dirt, or water gets in the refrigerant cycle, the refrigerant may deteriorate.

1.3. Before getting installed

**Caution:**
- Do not install the unit where combustible gas may leak.
  - If the gas leaks and accumulates around the unit, an explosion may result.
- Do not use the air conditioner where food, pets, plants, precision instruments, or artwork are kept.
  - The quality of the food, etc. may deteriorate.
- Do not use the air conditioner in special environments.
  - Oil, steam, sulfuric smoke, etc. can significantly reduce the performance of the air conditioner or damage its parts.
- When installing the unit in a hospital, communication station, or similar place, provide sufficient protection against noise.
  - The inverter equipment, private power generator, high-frequency medical equipment, or radio communication equipment may cause the air conditioner to operate erroneously, or fail to operate. On the other hand, the air conditioner may affect such equipment by creating noise that disturbs medical treatment or image broadcasting.
- Do not install the unit on a structure that may cause leakage.
  - When the room humidity exceeds 80% or when the drain pipe is clogged, condensation may drip from the indoor unit. Perform collective drainage work together with the outdoor unit, as required.
- The indoor models should be installed on a ceiling over 2.5 m from floor.

2. Indoor unit accessories

The unit is provided with the following accessories:

<table>
<thead>
<tr>
<th>No.</th>
<th>Accessories</th>
<th>Quantity</th>
<th>No.</th>
<th>Accessories</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Insulation pipe 25 mm small diameter</td>

<td>8</td>
<td>6</td>
<td>Drain hose</td>
<td>1</td>
</tr>
</tbody>
</table>

3. Selecting an installation site

- **Select a site with sturdy fixed surface sufficiently durable against the weight of unit.**
- Before installing unit, the routing to carry in unit to the installation site should be determined.
  - Select a site where the unit is not affected by entering air.
  - Select a site where the flow of supply and return air is not blocked.
  - Select a site where refrigerant piping can easily be led to the outside.
  - Select a site which allows the supply air to be distributed fully in room.
  - Do not install unit at a site with oil splashing or steam in much quantity.

1.4. Before getting installed (moved) - electrical work

**Caution:**
- Ground the unit.
  - Do not connect the ground wire to gas or water pipes, lightning rods, or telephone ground lines. Improper grounding may result in electric shock.
- Install the power cable so that tension is not applied to the cable.
  - Tension may cause the cable to break and generate heat and cause a fire.
- Install an earth circuit breaker, as required.
  - If an earth circuit breaker is not installed, electric shock may result.
- Use power line cables of sufficient current carrying capacity and rating.
  - Cables that are too small may leak, generate heat, and cause a fire.
- Use only a circuit breaker and fuse of the specified capacity.
  - A fuse or circuit breaker of a larger capacity or a steel or copper wire may result in a general unit failure or fire.
- Do not wash the air conditioner units.
  - Wasing them may cause an electric shock.
- Be careful that the installation base is not damaged by long use.
  - If the damage is left uncorrected, the unit may fall and cause personal injury or property damage.
- Install the drain piping according to this Installation Manual to ensure proper drainage. Wrap thermal insulation around the pipes to prevent condensation.
  - Improper drain piping may cause water leakage and damage to furniture and other possessions.
- Be very careful about product transportation.
  - Only one person should carry the product if it weighs more than 20 kg.
  - Some products use PP bands for packaging. Do not use any PP bands for a means of transportation. It is dangerous.
  - Do not touch the heat exchanger fins. Doing so may cut your fingers.
  - When transporting the outdoor unit, suspend it at the specified positions on the unit base. Also support the outdoor unit at four points so that it cannot slip sideways.
- Safely dispose of the packing materials.
  - Packing materials, such as nails and other metal or wooden parts, may cause stabs or other injuries.
  - Tear apart and throw away plastic packaging bags so that children will not play with them. If children play with a plastic bag which was not torn apart, they face the risk of suffocation.

1.5. Before starting the test run

**Caution:**
- Turn on the power at least 12 hours before starting operation.
  - Starting operation immediately after turning on the main power switch can result in severe damage to internal parts. Keep the power switch turned on during the operational season.
- Do not touch the switches with wet fingers.
- Do not touch the refrigerant pipes during and immediately after operation.
  - During and immediately after operation, the refrigerant pipes may be too hot and may be cold, depending on the condition of the refrigerant flowing through the refrigerant piping, compressor, and other refrigerant cycle parts. Your hands may suffer burns or frostbite if you touch the refrigerant pipes.
- Do not operate the air conditioner with the panels and guards removed.
  - Rotating, hot, or high-voltage parts can cause injuries.
- Do not turn off the power immediately after stopping operation.
  - Always wait at least five minutes before turning off the power. Otherwise, water leakage and trouble may occur.
3.2. Securing installation and service space
- Select the optimum direction of supply airflow according to the configuration of the room and the installation position.
- As the piping and wiring are connected at the bottom and side surfaces, and the maintenance is made at the same surfaces, allow a proper space properly. For the efficient suspension work and safety, provide a space as much as possible.

![Fig. 3.2.1 (P.2)]

① Access door
② Electrical parts box
③ Air outlet
④ Ceiling surface

3.3. Combining indoor units with outdoor units
For combining indoor units with outdoor units, refer to the outdoor unit installation manual.

4. Fixing hanging bolts

4.1. Fixing hanging bolts

![Fig. 4.1.1 (P.2)]

① Center of gravity

(Give site of suspension strong structure.)

5. Installing the unit

5.1. Hanging the unit body
- Bring the indoor unit to an installation site as it is packed.
- To hang the indoor unit, use a lifting machine to lift and pass through the hanging bolts.

![Fig. 5.1.1 (P.2)]

① Unit body
② Lifting machine

![Fig. 5.1.2 (P.2)]

③ Nut (field supply)
④ Washers (accessory)
⑤ M10 hanging bolt (field supply)

5.2. Transporting the heat exchanger unit and the fan unit separately
- Refer to the “Manipulation Details” label on the unit for how to separate the heat exchanger unit and the fan unit.

⚠️ Caution:
Heat exchanger unit and the fan unit cannot be installed in separate locations. Doing so will cause water leakage.

6. Refrigerant pipe and drain pipe specifications

To avoid dew drops, provide sufficient antiseaweeding and insulating work to the refrigerant and drain pipes.

When using commercially available refrigerant pipes, be sure to wind commercially available insulating material (with a heat-resisting temperature of more than 100 °C and thickness given below) onto both liquid and gas pipes.

Insulate all indoor pipes with form polyethylene insulation with a minimum density of 0.03 and a thickness as specified in the table below.

① Select the thickness of insulating material by pipe size.

<table>
<thead>
<tr>
<th>Pipe size</th>
<th>Insulating material’s thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.4 mm to 25.4 mm</td>
<td>More than 10 mm</td>
</tr>
<tr>
<td>25.6 mm to 38.1 mm</td>
<td>More than 15 mm</td>
</tr>
</tbody>
</table>

② If the unit is used on the highest story of a building and under conditions of high temperature and humidity, it is necessary to use pipe size and insulating material’s thickness more than those given in the table above.

③ If there are customer’s specifications, simply follow them.

5.3. Confirming the unit’s position and fixing hanging bolts
- Use the gage supplied with the panel to confirm that the unit body and hanging bolts are positioned in place. If they are not positioned in place, it may result in dew drops due to wind leak. Be sure to check the positional relationship.
- Use a level to check that the surface indicated by ① is at level. Ensure that the hanging bolt nuts are tightened to fix the hanging bolts.
- To ensure that drain is discharged, be sure to hang the unit at level using a level.

![Fig. 5.3.1 (P.2)]

① Indoor unit’s bottom surface

⚠️ Caution:
Install the unit in horizontal position. If the side with drain port is installed higher, water leakage may be caused.

6. Refrigerant pipe and drain pipe specifications

6.1. Refrigerant pipe and drain pipe specifications

<table>
<thead>
<tr>
<th>Item</th>
<th>Model</th>
<th>Model 140</th>
<th>Model 170-200</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refrigerant pipe</td>

① Air inlet
② Refrigerant piping (gas)
③ Drain pipe
④ Refrigerant piping (liquid)
⑤ Control box
⑥ Air outlet
7. Connecting refrigerant pipes and drain pipes

7.1. Refrigerant piping work
This piping work must be done in accordance with the installation manuals for both outdoor units.
- For constraints on pipe length and allowable difference of elevation, refer to the outdoor unit manual.
- For constraints on pipe length and allowable difference of elevation, refer to the outdoor unit manual.
- The method of pipe connection is flaring connection (PEA-140) and brazing connection (PEA-170, 200).

⚠️ Caution:
- Install the refrigerant piping for the indoor unit in accordance with the following.

7.2. Flaring work (PEA-140)
- Main cause of gas leakage is defect in flaring work.
- Carry out correct flaring work in the following procedure.

7.2.1. Pipe cutting
[Fig. 7.2.1] (P.3)
- Copper tubes
- Glass
- Nos good
- Tilted
- Uneven
- Burred

- Using a pipe cutter cut the copper tube correctly.

7.2.2. Burrs removal
[Fig. 7.2.2] (P.3)
- Burr
- Copper tube/pipe
- Spare reamer
- Pipe cutter

- Completely remove all burrs from the cut cross section of pipe/pipe.
- Put the end of the copper tube/pipe to downward direction as you remove burrs in order to avoid burrs drop in the tubing.

7.2.3. Putting nut on
[Fig. 7.2.3] (P.3)
- Flare nut
- Copper tube

- Remove flare nuts attached to indoor and outdoor unit, then put them on pipe/tube having completed burr removal.
  (not possible to put them on after flaring work)

7.2.4. Flaring work
[Fig. 7.2.4] (P.3)
- Flaring tool
- Die
- Copper tube
- Flare nut
- Yoke

- Carry out flaring work using flaring tool as shown below.

<table>
<thead>
<tr>
<th>Pipe diameter (mm)</th>
<th>Dimension</th>
<th>A (mm)</th>
<th>Clutch type</th>
<th>B_{max} (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.35</td>
<td>0 - 0.5</td>
<td>9.1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>9.52</td>
<td>0 - 0.5</td>
<td>13.2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>12.7</td>
<td>0 - 0.5</td>
<td>16.6</td>
<td></td>
<td></td>
</tr>
<tr>
<td>15.88</td>
<td>0 - 0.5</td>
<td>19.7</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Firmly hold copper tube in a die in the dimension shown in the table above.

7.2.5. Check
[Fig. 7.2.5] (P.3)
- Smooth all around
- Inside is shining without any scratches
- Even length all around
- Too much
- Tilted
- Scratch on flared plane
- Pea
- Cracked
- Uneven
- Bad examples

- Compare the flared work with a figure in right side hand.
- If flare is noted to be defective, cut off the flared section and do flaring work again.

7.3. Pipe connection
[Fig. 7.3.1] (P.3)
- Apply a thin coat of refrigeration oil on the seat surface of pipe.
- For connection first align the center, then tighten the first 3 to 4 turns of flare nut.
- Use tightening torque table below as a guideline for indoor unit side union joint section, and tighten using two wrenches. Excessive tightening damages the flare section.

<table>
<thead>
<tr>
<th>Copper pipe O.D.</th>
<th>Flare nut O.D.</th>
<th>Tightening torque</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.35 mm</td>
<td>17 mm</td>
<td>14 - 18 N·m</td>
</tr>
<tr>
<td>9.52 mm</td>
<td>22 mm</td>
<td>34 - 42 N·m</td>
</tr>
<tr>
<td>12.7 mm</td>
<td>26 mm</td>
<td>49 - 61 N·m</td>
</tr>
<tr>
<td>15.88 mm</td>
<td>29 mm</td>
<td>68 - 82 N·m</td>
</tr>
</tbody>
</table>

⚠️ Warning:
Be careful of flying flare nut (internally pressurized)
Remove the flare nut as follows:
1. Loosen the nut until you hear a hissing noise.
2. Do not remove the nut until the gas has been completely released (i.e., hissing noise stops).
3. Check that the gas has been completely released, and then remove the nut.

Refrigerant pipe insulation
- After connecting refrigerant piping, insulate the joints (flared joints) with thermal insulation tubing as shown below.

[Fig. 7.3.2] (P.3)
- Pipe cover (small) (accessory)
- Caution:
- Pull out the thermal insulation on the refrigerant piping at the site, insert the flare nut to flare the end, and replace the insulation in its original position.
- Take care to remove the refrigerant piping does not free on exposed copper piping.
- Liquid end of refrigerant piping
- Gas end of refrigerant piping
- Site refrigerant piping
- Main body
- Pipe cover (large) (accessory)
- Thermal insulation (field supply)
- Pull
- Flare nut
- Return to original position
- Ensure that there is no gap here
- Plate on main body
- Band (accessory)
- Ensure that there is no gap here. Place joint upwards.

1. Remove and discard the rubber bung which is inserted in the end of the unit piping.
2. Flare the end of the site refrigerant piping.
3. Pull out the thermal insulation on the site refrigerant piping and replace the insulation in its original position.

Cautions On Refrigerant Piping
- Be sure to use non-oxidative brazing for brazing to ensure that no foreign matter or moisture enter into the pipe.
- Be sure to apply refrigerating machine oil over the flare connection setting surface and tighten the connection using a double spanner.
- Provide a metal brace to support the refrigerant pipe so that no load is imparted to the indoor unit end pipe. This metal brace should be provided 50 cm away from the indoor unit's flare connection.
7.4. Brazing work (PEA-170, 200)

1. Cut the tip of the indoor unit piping, remove the gas, and then remove the brazed cap.
   [Fig. 7.4.1] (P.3)
   - Cut here
   - Remove brazed cap

2. Pull out the thermal insulation on the site refrigerant piping, braze the unit piping, and replace the insulation in its original position. Wrap the piping with insulating tape.
   
   Note:
   - When brazing the refrigerant pipes, be sure to blazo, after covering a wet cloth to the pipes of the units in order to prevent it from burning and shrinking by heat.
   [Fig. 7.4.2] (P.3)
   - Cool by a wet cloth
   - Pay strict attention when wrapping the copper piping since wrapping the piping may cause condensation instead of preventing it.
   [Fig. 7.4.3] (P.4)
   - Thermal insulation tubing (small)
   - Caution: Pull out the thermal insulation on the refrigerant piping at the site, braze the piping, and replace the insulation in its original position. Take care to ensure that condensation does not form on the outer copper piping.
   - Refrigerant piping (cable)
   - Refrigerant piping (gas)
   - Main body
   - Thermal Insulation tubing (large)
   - Site refrigerant piping
   - Ensure that there are no gaps between the insulation and the main body.
   - Thermal Insulation tubing (small) (supplied) 1
   - Tie (large) (supplied) 4
   - Ensure that there is no gap here. Place join upwards.
   - Thermal Insulation tubing (medium) (supplied) 2
   - Thermal Insulation
   - Pull
   - Flared pipe end
   - Wrap with damp cloth
   - Return to original position
   - Ensure that there is no gap here.

Cautions On Refrigerant Piping

- Be sure to use non-oxidative brazing for brazing to ensure that no foreign matter or moisture enter into the pipe.
- Be sure to apply refrigerating machine oil over the flare connection seating surface and tighten the connection using a double spanner.
- Provide a metal brace to support the refrigerant pipe so that no load is imparted to the indoor unit end pipe. This metal brace should be provided 50 cm away from the indoor unit’s flare connection.

⚠️ Warning:
Do not use refrigerant other than the type indicated in the manuals provided with the unit and on the nameplate.
- Doing so may cause the unit or pipes to burst, or result in explosion or fire during use, during repair, or at the time of disposal of the unit.
- It may also be in violation of applicable laws.
- MITSUBISHI ELECTRIC CORPORATION cannot be held responsible for malfunctions or accidents resulting from the use of the wrong type of refrigerant.

8. Duct work

- When connecting ducts, insert a canvas duct between the main body and the duct.
- Use non-combustible duct components.
- Install sufficient thermal insulation to prevent condensation forming on outlet duct flanges and outlet ducts.

⚠️ Caution:
- Keep the distance between the inlet grille and the fan over 850 mm. If it is less than 850 mm, install a safety guard not to touch the fan.

[Fig. 8.0.1] (P.9)
- Air inlet
- Duct
- Access door

- Keep ductwork length 850 mm or more
Precautions on electrical wiring

**Warning:**
Electrical work should be conducted by qualified electrical engineers in accordance with "Engineering Standards For Electrical Installation" and supplied installation manuals. Special equipment should also be used, if the power circuit lacks capacity or has an installation failure, it may cause a risk of electric shock or fire.

1. Be sure to install an earth leakage breaker to the power.
2. Install the unit to prevent the loss of the control circuit cables (remote controller, transmission cables) brought in direct contact with the power cable outside the unit.
3. Ensure that there is no slack on all wire connections.
4. Some cables (power, remote controller, transmission cables) above the ceiling may be bitten by mice. Use any metal pipes as possible to insert the cables into them for protection.
5. Never connect the power cable to the controls for the transmission cables. Otherwise the cables would be broken.
6. Be sure to connect control cables to the indoor unit, remote controller, and the outdoor unit.
7. Put the unit to the ground on the outdoor unit side.

**Caution:**
Be sure to put the unit to the ground on the outdoor unit side. Do not connect the earth cable to any gas pipe, water pipe, lighting rod, or telephone earth cable. Incomplete grounding may cause a risk of electric shock.

### Types of control cables

1. **Wiring transmission cables**
   - Transmission cables shall not be lighter than polyvinyl chloride sheathed flexible cord. (Design 245 IEC 57)
   - Types of transmission cables
     - Designing in accordance with the following table (Table 1).
     - Cable diameter
       - More than 1.5 mm²
     - Cable length
       - Less than 80 m.
     - Circuit rating
       - S1: 52: 220V AC
       - S2: 53: 24V DC
     - The figures are not always against the ground.
     - S3 terminal has 24V DC against S2 terminal. However between S3 and S1, these terminals are not electrically insulated by the transformer or other device.

2. **Remote controller cables**
   - **MA remote controller**
     - Types of cables
       - Shielded 2-core cable (unshieded) CVV
     - Cable diameter
       - 0.3 to 1.25 mm²
     - Length
       - Less than 500 m

### 9.1 Power supply wiring

- Power supply cord of appliances shall not be lighter than design 245 IEC 57 or 227 IEC 57.
- A switch with at least 3 mm contact separation in each pole shall be provided by the Air conditioner installation.

**Power cable size:** more than 1.8 mm²

[Fig. 9.1.1] (P.5)
- [Selecting non-fuse breaker (NF) or earth leakage breaker (NV)]
  - To select NF or NV instead of a combination of Class B fuse with switch, use the following:
    - In the case of Class B fuse rated 15 A or 20 A.
    - NF model name (MITSUBISHI): NF30-CS (15 A) (20 A)
    - NV model name (MITSUBISHI): NV30-CA (15 A) (20 A)
    - Use an earth leakage breaker with a sensitivity of less than 30 mA 0.1 s.

**Caution:**
Do not use anything other than the correct capacity breaker and fuse. Using fuse, wire or copper wire with too large capacity may cause a risk of malfunction or fire.

### 9.2 Connecting remote controller, indoor and outdoor transmission cables

**Warning:**
- The compressor will not operate unless the indoor/outdoor transmission phase connection is correct.
- The connection wiring between the outdoor and indoor units can be extended up to a maximum of 50 meters, and the total extension including the crossover wiring between rooms is a maximum of 80 m.
- **Connect indoor unit TB4 and terminal block for indoor-outdoor transmission line.** (Polar 3-core)
  - Cable 3-core 1.5 mm², in conformity with design 245 IEC 57.
  - Install a remote controller following the manual supplied with the remote controller.
  - Connect the "1" and "2" on indoor unit TB15 to a MA remote controller. (Non-polarized 2-wire)
  - Connect the remote controller's transmission cable within 10 m using a 0.75 mm² core cable. If the distance is more than 10 m, use a 1.25 mm² connection cable.

[Fig. 9.2.1] (P.5) MA Remote Controller
- **Terminal block for indoor transmission cable**
- **Terminal block for outdoor transmission cable**
- Remote controller
- DC 9 to 12 V between 1 and 2 (MA remote controller)

[Fig. 9.2.2] (P.5) MA Remote Controller
- **Non-polarized**
- **TB15**
- **Remote Controller**
- **TB4**

**Caution:**
Install wiring so that it is not tight and under tension. Wiring under tension may break, or overheat and burn.

### 9.3 Connecting electrical connections

Please identify the model name of the operation manual attached on the terminal bed cover with that shown on the rating name plate.

1. Remove the screw (2pcs) holding the cover to discount the cover.

[Fig. 9.3.1] (P.5)
- [Selecting non-fuse breaker (NF) or earth leakage breaker (NV)]
  - Use a screwdriver or the like for this work.

[Fig. 9.3.2] (P.5)
- **Terminal block**
- **Knockout hole**
- **Remove**

2. Fix power source wiring to terminal bed box by using buffer bushing for tensile force. (PG connection or the like.) Connect transmission wiring to transmission terminal bed through the knockout hole of terminal bed box using ordinary bushing.

3. Connect the power source, Earth, transmission and remote controller wiring. The dismounting of the terminal bed box is not needed.

[Fig. 9.3.3] (P.6)
- Use PG bushing to keep the weight of the cable and external force from being applied to the power supply terminal connector. Use a cable tie to secure the cable. Wind the wire around the cable strap once to keep it from being pulled out.
- **Power source wiring**
- **Terminal bed**
- **Knockout hole**
- **Use ordinary bushing**
- **Terminal bed for indoor transmission**
- **Terminal bed for remote controller**
- **To 1-phase power source**
- **Transmission line**
- **Terminal bed for outdoor transmission line**
- **Transmission line to the remote controller**

[Transmission cable connection]

[Fig. 9.3.4] (P.6)
- **Terminal bed**
- **Round terminal**
- **Transmission cable (polar)**

5. After wiring is complete, make sure again that there is no slack on the connections, and attach the cover onto the terminal bed box in the reverse order of removal.

**Notes:**
- Do not pinch the cables or wires when attaching the terminal bed box cover. Doing so may cause a risk of disconnection.
- When accommodating the terminal bed box, make sure that the connectors on the box side are not removed. If removed, it cannot operate normally.

### 9.4 Function settings

#### 9.4.1 Function setting on the unit (Selecting the unit functions)

1) Changing the external static pressure setting [Fig. 9.4.1] (P.6)
- Be sure to change the external static pressure setting depending on the duct and the grill used.
- Go to the function setting mode.
  - Switch OFF the remote controller.
  - Press [ ] and [ ] buttons simultaneously and hold them for at least 2 seconds. FUNCTION will start to flash.
- Use the [ ] button to set the refrigerant address (III) to 00.
- Press [ ] and [ ] will start to flash in the unit number (IV) display.
- Use the [ ] button to set the unit number (IV) to 01-04 or 0AL.
9.5. Before test run

- After completing installation and wiring and piping of the indoor and outdoor units, check for refrigerant leakage, looseness in the power supply or control wiring, wrong polarity, and no disconnection of one phase in the supply.
- Use a 500-volt megohmmeter to check that the resistance between the power supply terminals and ground is at least 1.0 MO.
- Do not carry out this test on the control wiring (low voltage circuit) terminals.

⚠️ Warning:

Do not use the air conditioner if the insulation resistance is less than 1.0 MO.

Insulation resistance

After installation or after the power source to the unit has been cut for an extended period, the insulation resistance will drop below 1 MO due to refrigerant accumulating in the compressor. This is not a malfunction. Perform the following procedures.

1. Remove the wire from the compressor and measure the insulation resistance of the compressor.
2. If the insulation resistance is below 1 MO, the compressor is faulty or the resistance dropped due to the accumulation of refrigerant in the compressor.
3. After connecting the wires to the compressor, the compressor will start to warm up after power is supplied. After supplying power for the times indicated below, measure the insulation resistance again.
   - The insulation resistance drops due to accumulation of refrigerant in the compressor. The resistance will rise above 1 MO after the compressor is warmed up for two to three hours. (The time necessary to warm up the compressor varies according to atmospheric conditions and refrigerant accumulation.)
   - To operate the compressor with refrigerant accumulated in the compressor, the compressor must be warmed up at least 12 hours to prevent breakdown.
4. If the insulation resistance rises above 1 MO, the compressor is not faulty.

⚠️ Caution:

- The compressor will not operate unless the indoor/outdoor transmission phase connection is correct.
- Turn on the power at least 12 hours before starting operation.
- Starting operation immediately after turning on the main power switch can result in severe damage to internal parts. Keep the power switch turned on during the operational season.

9.6. Test run

9.6.1. Using wired remote controller

- Turn on the power at least 12 hours before the test run.
- Press the [TEST] button twice. \# TEST RUN \# liquid crystal display
- Press the [Mode selection] button. ➔ Make sure that wind is blown out.
- Press the [Mode selection] button and switch to the cooling (or heating) mode. ➔ Make sure that cold (or warm) wind is blown out.
- Press the [Fan speed] button. ➔ Make sure that the wind speed is switched.
- Check operation of the outdoor unit fan.
- Release test run by pressing the [ON/OFF] button. ➔ Stop
- Register a telephone number.
  - Telephone number of the repair shop, sales office, etc., to contact if an error occurs can be registered in the remote controller. The telephone number will be displayed when an error occurs. For registration procedures, refer to the operating manual for the indoor unit.

[Fig. 9.6.1] (P.6)

- [ON/OFF] button
- [TEST run display]
- [Indoor temperature display] / [line temperature display]
- [ON/OFF] button
- [Fan speed display]
- [Error code display]
- [Test run remaining time display]
- [Get temperature button]
- [Mode selection button]
- [Fan speed button]
- [TEST button]

9.7. Self-check

9.7.1. Wired remote controller

- Turn on the power.
- Press the [CHECK] button twice.
- Set refrigerant address with [TEMP] button if system control is used.
- Press the [ON/OFF] button to stop the self-check.

[Fig. 9.7.1] (P.6)

- [CHECK button]
- [Refrigerant address]
- [TEMP. button]
- [LC]: Indoor unit
- [OC]: Outdoor unit
- [Check code]
- For description of each check code, refer to the following table.

<table>
